Objectives of the Course

To get insight in the spacecraft structural design, analysis and verification process related to ECSS standards, handbooks and other literature (books & papers).

Overview of Sub-Course E-32 Structures

- 1. General introduction to Structural Verification Cycle
- Load types and derivation (steady state, low frequency dynamics, high frequency acoustics and structure born vibrations, shock, thermal, constraints, micro-vibrations, ...)
- 3. Development Approach (prototype, proto-flight, STM, ...)
- 4. Design of Structures (material, processes, assembles, joints, allowable stress/load, ...)
- 5. Mechanical Analysis (models, validation, static dynamic, acoustic, stability, thermo-elastic, micro-vibrations, sloshing, system, subsystem)
- 6. Damage Tolerance (hardware inspection, analytical verification, specific testing, ...)
- 7. Testing (static, modal, sine, acoustic, random, thermal, micro-vibrations, pressures, ...)
- 8. Structural requirements flow down
- 9. Mechanical Interfaces (Handbooks)

Definition of Structures

- Structures support spacecraft key components in desirable locations.
- Structures protect the spacecraft's components from dynamic environments during ground operations, launch, deployment and mission's operations
- Structures vibrations must not interfere with launch vehicle's vibrations
- The materials must survive ground, launch, on-orbit environments.

Scope

- ECSS-E-ST-32C (Space engineering Structural) defines the mechanical engineering requirements for structural engineering.
- This Standard specifies the requirements to be considered in all engineering aspects of structures: requirement definition and specification, design, development, verification, production, inservice and eventual disposal.
- The Standard applies to all general structural subsystem aspects of space products including: launch vehicles, transfer vehicles, reentry vehicles, spacecraft, landing probes and rovers, sounding rockets, payloads and instruments, and structural parts of all subsystems.
- This Standard may be tailored for the specific characteristics and constraints of a space project in conformance with ECSS-S-ST-00.

Structural General Requirements ECSS-E-ST-32C, Rev. 1, TOC

- Terms, definition abbreviations
- Requirements
 - Mission
 - Functionality
 - Interface
 - Design
 - Verification
 - Production and manufacturing
 - In-service
 - Data-exchange
 - Deliverables

Mission

- Lifetime
- Natural and Induced Environment
- Mechanical environment
- Microgravity, audible noise and human induced vibration
- Load events
- Combined loads
- Limit Loads (Prob. 99%, CL 90%)
- Design Limit loads

Space engineering

Functionality

- Strength
- Local yielding
- Buckling
- Stiffness
- Dynamic behavior
- Thermal
- Damage tolerance
- Tolerances and Alignments
- Electrical conductivity
- Lighting protection
- Electro Magnetic Compatibility
- Dimensional Stability

Space engineering

Interfaces (E-32)

- Internal interfaces
 - Thermal control
 - Mechanisms
 - ECLS
 - Propulsion
 - Pyrotechnics
 - Mechanical parts
 - Materials
- External interfaces
 - Spacecraft-Launcher interface
 - Human factors and ergonomics
 - Interface with equipment, optics and avionics
 - Rendezvous and docking
 - Ground support equipment for pre-flight and post flight operations
 - Support equipment for in-orbit operations

Space engineering

Design

- Inspectability
- Interchangeability
- Maintainability
- Dismountability
- Mass & Inertia properties
- Material selection
- Mechanical part selection
- Material design allowables
- Metals
- Non-metallic materials (Ceramics & Glass)

- Composite materials
- Adhesive materials in bonded joints
- Ablation and pyrolysis
- Micrometeoroid and debris collision
- Venting
- Margins of Safety
- Factors of Safety
- Scatter factors

Space engineering

Verification

- Verification by Analysis
- Verification by Test
- Verification by commonality

Space engineering

Production and manufacturing

- Manufacturing process
- Manufacturing drawings
- Tooling
- Assembly
- Storage
- Cleanliness
- Health and Safety

Space engineering

In-Service

- Ground inspection
- In-orbit inspection
- Evaluation of damages
- Maintenance
- Repair

Space engineering

Data Exchange

- System configuration data
- Data exchange between design and structural analysis
- Data exchange between structural design and manufacturing
- Data exchange with other subsystems
- Tests and structural analysis
- Structural mathematical models
- Data traceability

Space engineering

Deliverables (Normative)

- Computer aided design model description and delivery (CADMDD)-DRD
- Design Loads (DL)-DRD
- Dimensional Stability Analysis (DSA)s-DRD
- Fatigue Analysis (FA)-DRD
- Fracture Control Analysis (FSA)-DRD
- Fracture Control Plan-DRD
- Fracture Control Items Lists (PFCIL, FCIL, FLLIL)-DRD
- Materials and Mechanical Part Allowables (MMPA)-DRD
- Mathematical Model Description and Delivery (MMDD)-DRD
- Modal and Dynamic Response Analysis (MDRA)-DRD
- Stress and Strength Analysis (SSA)-DRD
- Structural Alignment Budget (SAB)
- Structure Buckling (SB)-DRD
- Structure Mass Summary (SMS)-DRD
- Test-Analysis Correlation (TAC)-DRD
- Test Evaluation (TE)-DRD
- Test Predictions (TP)-DRD

Overview of Sub-Course E-32 Structures

1. General introduction to Structural Verification Cycle

- Load types and derivation (steady state, low frequency dynamics, high frequency acoustics and structure born vibrations, shock, thermal, constraints, micro-vibrations, ...)
- 3. Development Approach (prototype, proto-flight, STM, ...)
- 4. Design of Structures (material, processes, assembles, joints, allowable stress/load, ...)
- 5. Mechanical Analysis (models, validation, static dynamic, acoustic, stability, thermo-elastic, micro-vibrations, sloshing, system, subsystem)
- 6. Damage Tolerance (hardware inspection, analytical verification, specific testing, ...)
- 7. Testing (static, modal, sine, acoustic, random, thermal, micro-vibrations, pressures, ...)
- 8. Structural requirements flow down
- 9. Mechanical Interfaces (Handbooks)

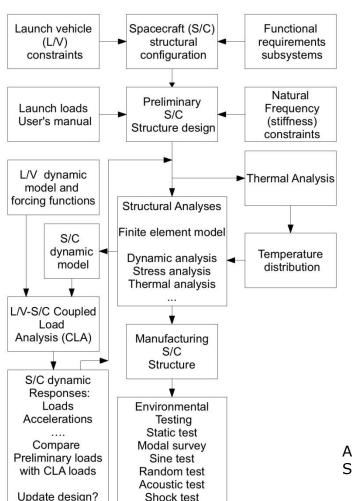

General Introduction Structural Verification Cycle

- Test

Design & Verification

General introduction to Structural Design Verification cycle

Agrawal, B.N. (1986) Design of Geosynchronous Spacecraft, Prentice Hall, ISBN 0-13-200114-4

Design & Verification (Cont'd)

Remarks:

- CLA performed at least three times
 - Preliminary design (PCLA). Phase B
 - Design cycle (DCLA). Phase C
 - Verification cycle (VCLA). Mathematical model test/analysis correlated. Phase D
- Shock test only performed on STM

Overview of Sub-Course E-32 Structures

- 1. General introduction to Structural Verification Cycle
- 2. Load types and derivation (steady state, low frequency dynamics, high frequency acoustics and structure born vibrations, shock, thermal, constraints, micro-vibrations, ...)
- 3. Development Approach (prototype, proto-flight, STM, ...)
- 4. Design of Structures (material, processes, assembles, joints, allowable stress/load, ...)
- 5. Mechanical Analysis (models, validation, static dynamic, acoustic, stability, thermo-elastic, micro-vibrations, sloshing, system, subsystem)
- 6. Damage Tolerance (hardware inspection, analytical verification, specific testing, ...)
- 7. Testing (static, modal, sine, acoustic, random, thermal, micro-vibrations, pressures, ...)
- 8. Structural requirements flow down

Space engineering

Structural general requirements

Loads

Ground, Launch, on Orbit and Descent (re-entry & landing)

Load Events

- Relevant mechanical and thermal loads expected through the service life of the structure is to be identified
- Loads are to be defined according to their nature (i.e. static or dynamic) and their level, occurrence time and duration
- ECSS-E-ST-32C
 - Ground loads
 - Test Loads
 - Launch Loads
 - In-Orbit Loads
 - Re-entry, descent and Landing

Load Events (Cont'd)

Ground Loads

- Handling Loads
- Transportation Loads
- Storage Loads
- Assembly & Integration Loads

Ground Test Loads

- Static
- Shaker test
- Acoustic Test
- Shock Test

Launch Loads

- Launch preparation
- Operational pressures
- Engines ignition
- Thrust built-up
- Aborted Launch
- Lift-off
- Thrust
- Aerodynamic Loads
- Heat flux
- Wind & gust
- Dynamic interaction L/V and Engines (POGO)
- Thrust decay
- Maneuvers
- Pyrotechnics
- Depressurization

Load Events (Cont'd)

Ground In-orbit loads

- Operational pressures
- Static and dynamic loads induced by thrusters
- Shocks (pyrotechnics, deployment)
- Thermo-elastic loads
- Hygroscopic-induced loads
- Micro-vibrations
- Micrometeoroids & Debris
- Docking
- Berthing
- Crew induced loads

Re-entry, descent and Landing

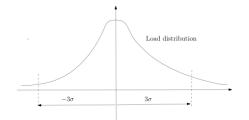

- Aerodynamic Loads
- Thermal fluxes
- Parachute ejection and deployment shocks
- Operation pressures
- Land loads
- Impact Loads

Spacecraft Environmental Load Conditions Mechanical Environment(e.g. ARIANE 5)

- Probability loads will be exceeded is 1% (90% CL, Rockot)
- Overall Loads
 - Static Acceleration (steady-state)
 - Launch direction <=4.55g</p>
 - Lateral direction <= 0.25g</p>
 - Static pressure under the fairing (on ground, in flight (depressurization)
 - Sine-equivalent dynamics (derived from SRS)
 - Random vibration (covered by sine and acoustics at system level)
 - Acoustic vibration (lift-off, aerodynamics)
 - Shocks
 - Spacecraft separation
 - Fairing jettison
 - Upper stage separation (cryogenic stage)
 - Thermal environment

Stiffness Requirements

Dynamic decoupling spacecraft from launch vehicle

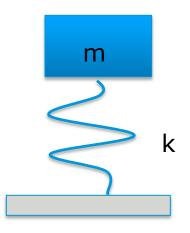

Stiffness Requirements A5 User's Manual

Lateral frequencies

The fundamental (primary) frequency in the lateral axis of a spacecraft cantilevered at the interface must be as follows (provided that a off the self adapter will be used for flight):

S/C mass (kg)	Launcher interface diameter (mm)	1* fundamental lateral frequency (Hz)	Transverse inertia wrt separation plane (kg.m²)
< 4500	< Ø2624	≥ 10	≤ 50,000
V 4300	Ø2624	≥9	2 30,000
4500 ≤ M M ≤ 6500	≤ Ø2 624	≥ 8	≤ 90,000
M > 6500	Ø2624	≥ 7.5	≤ 535,000
M > 0500	< Ø2624	TBD	TBD

No secondary mode should be lower than the first primary mode.

Longitudinal frequencies

The fundamental frequency in the longitudinal axis of a spacecraft cantilevered at the interface must be as follows (provided that an off-the-self adapter will be used for flight):

No secondary mode should be lower than the first primary mode.

$$f = \frac{1}{2p} \sqrt{\frac{k}{m}} \left(Hz \right)$$

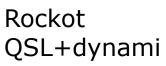

Quasi-Static Loads

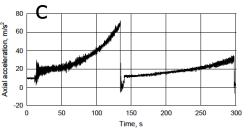

- Loads independent of time or which vary slowly, so that the dynamic response of the structure is not significant (Definition ECSS-E-ST-32C)
- Combination of static and dynamic loads into an equivalent static load specified for design purposes
 - Note 1: quasi static loads are equivalent to (or interpreted by the designer as) static loads, typically expressed as equivalent accelerations at the C.o.G
 - Note 2: In some contexts the quasi static loads are understood as "Loads associated to a quasi static event" (LV/SC CLA terminology)
- Quasi Static Event: Event generated by external forces which change slowly with time so that the dynamic response of the structure is not significant (Definitions ECSS-32-HDB-26, draft)
- Typical definition: Combination of steady-sate-acceleration plus low frequency dynamic (transient or pressure oscillations) response

Quasi-Static Loads (A5 User's manual)

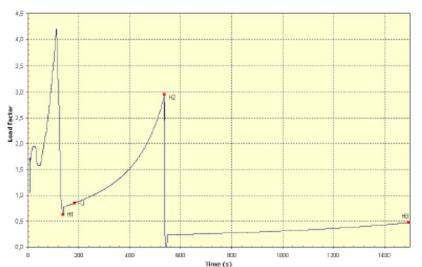

Acceleration (g)	Longitudinal		Lateral	Additional line load (N/mm)
Critical flight events	Static	Dynamic	Static + Dynamic	
Lift-off	- 1.8	± 1.5	± 2	26
Aerodynamic phase	- 2.7	± 0.5	± 2	23
Pressure oscillations / SRB end of flight	- 4.40	± 1.6	± 1	37
SRB jettisoning *	-0.7	± 3.2	± 0.9	0

^{*} This flight phase leads to a 2.5 g tension case, except for a spacecraft with first longitudinal frequency above 40 Hz where the tension value is the following:

Flight Limit Loads

Sine Equivalent Dynamics (A5 User's manual)

Direction	Frequency band (Hz)	Sine amplitude (g)	
Longitudinal	2 - 50	1.0	
Longitudinai	50 - 100	0.8	
Lateral	2 - 25	8.0	
	25 - 100	0.6	

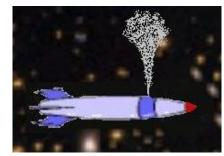

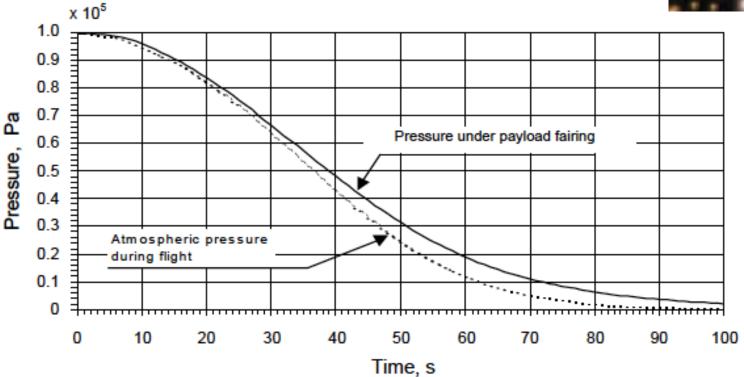

Sine excitation at spacecraft base (Limit Loads)

Depressurization under the fairing (Venting)

Venting

- Provision shall be made in the design of the structure for venting in order to prevent a build- up of excess pressure and to reduce the time to evacuate the structure, a minimum ratio of venting- area to enclosed- volume is usually needed for venting.
- In case that provision is not made, the structure shall withstand buildup pressure (including safety factors).
- The openings for venting shall be compatible with the purging system gas supply pressure and flow rate.

- Examples
 - Create Venting holes in closed structures
 - Perforated honeycomb in sandwich structures

Acoustic Loads (Noise)

- Lift-Off, Atmospheric Flight
- One-third, Octave bands
- Sound Pressure Levels
 - dB
 - OASPL

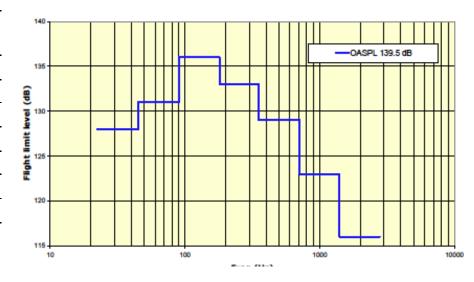

Space engineering

500	129
1000	123
2000	116
OASPL (20 - 2828 Hz)	139.5

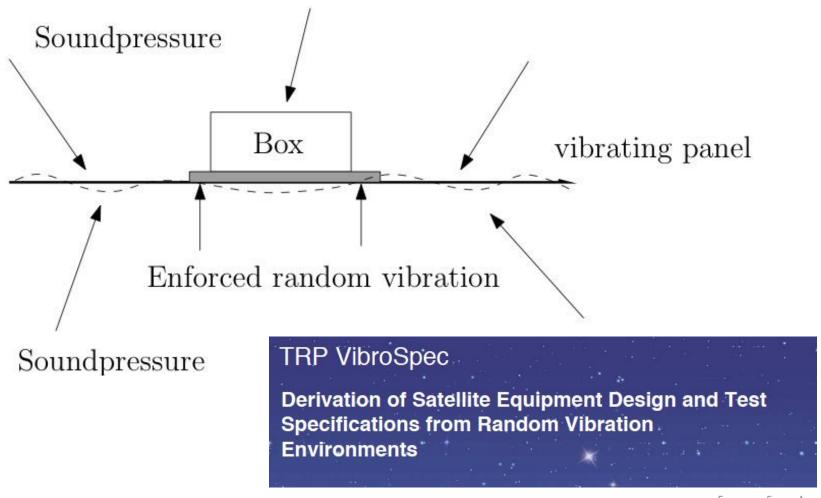

Acoustic noise spectrum(SPL) under the fairing (A5 User's manual)

$$\begin{split} SPL(f) = 10 log \overset{\mathcal{R}}{\varsigma} \frac{p_{rms}^2(f) \overset{\ddot{0}}{\circ}}{p_{ref}^2} \overset{\dot{c}}{\circ} (dB) & p_{rms}^2(f) = p_{ref}^2 10^{\frac{SPL(f)}{10}} \left(Pa^2\right) \\ & W_p\left(f\right) = \frac{p_{rms}^2(f)}{Df} \left(\frac{Pa^2}{Hz}\right) \end{split}$$

European Space Agency

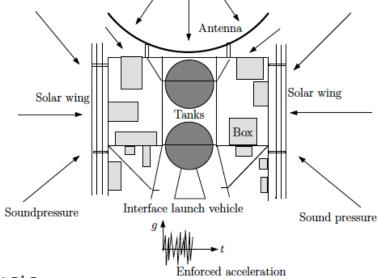

Structure Born Random Vibrations

Random Vibration

- Structure born
- Via interface spacecraft/Launch Venicle

Definition: vibration load whose instantaneous magnitudes are specified only by probability distribution functions giving the probable fraction of the total time that the instantaneous magnitude lies within a specified range.

Random Vibration via interface Spacecraft/Launch Vehicle (Soyuz)

	Frequency Band (Hz)					Dumatian of		
Event	20 – 50	50-100	100-200	200-500	500- 1000	1000- 2000	G _{RMS} (g)	Duration of application (s)

Design of Instruments/Equipment

- Mass Acceleration Curve (MAC)
- Preliminary design instruments, Units, ...

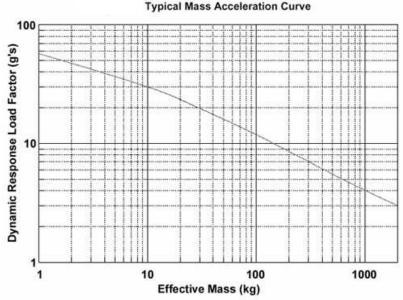

Mass Acceleration Curve

The MAC is an upper bound acceleration level for all components of a given mass, regardless of location, orientation, or frequency. Applicability is limited to appendage masses up to 500 kg, with frequencies up to approximately 100 Hz. Such a curve can be derived based on analytical and flight data, and includes the effects of both transient and mechanically transmitted random vibration. That is, the load predicted by the curve is already a combination of transient and random vibration.

Not mentioned in ECSS-E-ST-32C

NASA PD-ED 1211 Combination methods for Deriving Structural Design Loads ...

Statically Indeterminate Structures

The structure is called statically indeterminate when the number of reaction forces is more than the number of available 6 equations of equilibrium (3 translations and 3 rotations)

Statically Indeterminate Structures

Definition:

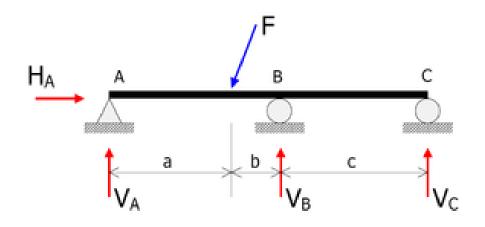

The structure is called statically indeterminate when the number of reaction forces is more than the number of available 6 equations of equilibrium (3 translations and 3 rotations)

$$\overset{3}{\underset{k=1}{\overset{3}{\bigcirc}}}F_{k}=0,$$

$$\overset{3}{\underset{k=1}{\overset{3}{\bigcirc}}}M_{k}=0,$$

Example

- 2 equations of equilibrium
- 4 reaction forces
- 1 Degree of statically indeterminacy
- 1 equation of compliancy needed

http://www.youtube.com/watch?v=q0_piF4-eNc&feature=related

Statically Indeterminate Structures (Cont'd)

- Indeterminate Structures
 - Advantages
 - Smaller stress
 - Greater stiffness
 - Redundancies
 - Disadvantages
 - Stress due to support settlements
 - Stresses due to temperature changes and fabrication errors

Statically Indeterminate Structures (Cont'd)

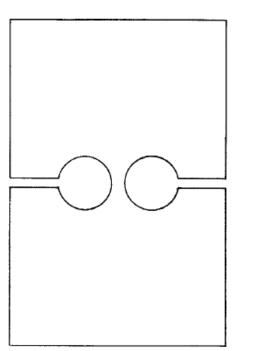

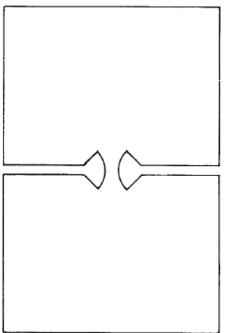

- Determinate Structures (Stress free thermal expansion)
 - Optical benches
 - Suspension system of instruments (Kinematic mounts)
 - Simple interfaces
 - Not fail-safe
- Indeterminate Structures
 - Load carrying structures
 - Complex interfaces

Overview of Sub-Course E-32 Structures

- 1. General introduction to Structural Verification Cycle
- Load types and derivation (steady state, low frequency dynamics, high frequency acoustics and structure born vibrations, shock, thermal, constraints, micro-vibrations, ...)
- 3. Development Approach (prototype, proto-flight, STM, ...)
- 4. Design of Structures (material, processes, assembles, joints, allowable stress/load, ...)
- 5. Mechanical Analysis (models, validation, static dynamic, acoustic, stability, thermo-elastic, micro-vibrations, sloshing, system, subsystem)
- 6. Damage Tolerance (hardware inspection, analytical verification, specific testing, ...)
- 7. Testing (static, modal, sine, acoustic, random, thermal, micro-vibrations, pressures, ...)
- 8. Structural requirements flow down
- 9. Mechanical Interfaces (Handbooks)

Space engineering

Structural general requirements

Development Approach

- Prototype Approach
- Protoflight Approach
- Hybrid Approach

Definitions

Prototype Approach

- The qualification testing can be conducted on one or more qualification model (QM), according to the project requirements and objectives, always with qualification levels and duration.
- For tests on more than one QM, the tests shall be performed on the different models according to their representativeness (e.g. functional qualification is performed on EQM) and the test sequences for each model shall be adapted accordingly.
- The FM shall be subjected to complete acceptance testing.
- Qualification of systems

Protoflight Approach

- All the qualification tests shall be performed on the same model to be flown, normally with qualification levels and reduced duration.
- The protoflight model (PFM) should be subjected to a test program defined on a case-by-case basis.
- The test program combines both qualification and acceptance tests to satisfy the qualification and the acceptance objectives

Definitions (Cont'd)

- Hybrid Approach
 - A combination of the prototype and protoflight rules shall be applied.
 - Specific qualification testing in the critical areas can be conducted on dedicated models (e.g. STM, QM, EQM or others).
 - In critical areas acceptance testing shall be performed only on the PFM.
 - STM =Structural Thermal Model
 - QM = Qualification Model
 - EQM = Electric(Engineering?) Qualification Model
 - ❖ FM = Flight Model
 - PFM = Protoflight model

Overview of Sub-Course E-32 Structures

- 1. General introduction to Structural Verification Cycle

- Factors of Safety / Margin of Safety
- Allowable Stress/Load

Preliminary Design of Spacecraft Structure

Reference, J.J. Wijker Spacecraft Structures, Springer, ISBN 978-3-540-75552-4, 2008

Space engineering

ECSS-E-ST-32-10C Rev.1 6 March 2009

Structural factors of safety for spaceflight hardware

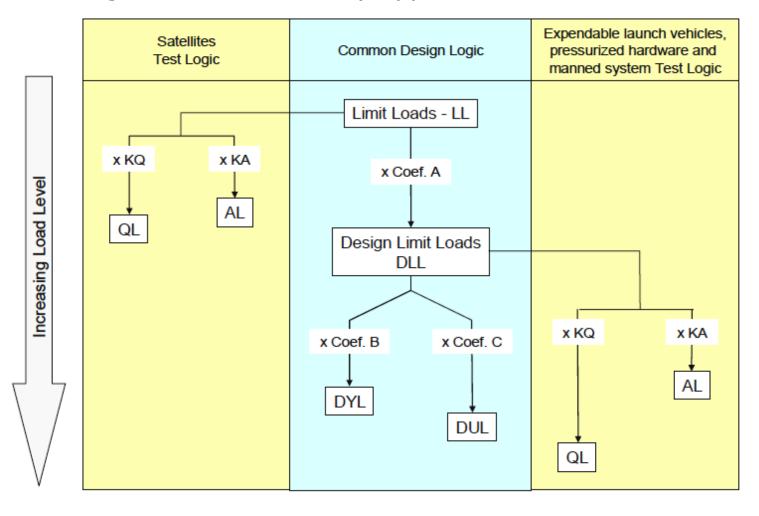

Structural Factors of Safety

- Spacecraft
- Launch vehicles
- Pressurized hardware
- Man-rated spacecraft
- Design Load Factors for Loads
- Additional factors for design
- Test factors

Test Factors/Factors of Safety

Logic of Factor of Safety Application

Test Factors/Factors of Safety (Cont'd)

Relationship among structural factors of safety, design factors and additional factors

Coefficient	Satellite	Launch vehicles and pressurised hardware	Man-rated systems	
Coef A or Design factor	КQ х К₽х Км	Крх Км	Крх Км	
Coef B	FOSY x Kld	FOSY x Kmp x Kld	FOSY x Kld	
Coef C	FOSU x Kld	FOSU x Kmp x Kld	FOSU x Kld	

Test Factors

KQ and KA provided by ECSS-E-ST-32-10C

- Spacecraft
- Launch Vehicle
- Man-rated Spacecraft

Type of Load

- Internal pressure
- Dynamic Loads
- Hoisting Loads
- Storage and Transportation Loads
- Thermal Loads

Factors of Safety FoSY and FoSU

FoSY and FoSU provided for ECSS-E-ST-32-10C

- Spacecraft
- Launch Vehicle
- Man-rated Spacecraft

Type of structural material, failure mode, ...

- Metallic Structures
- FRP structure; undisturbed, disturbed (hole, joints,)
- Sandwich structures
- Glass & Ceramic structures
- Joints (gapping, sliding) inserts,
- Buckling (global, local)
- Pressurized hardware

Margin of Safety (MoS)

Margins of Safety (MoS) are to be calculated by the following formula

$$MoS = \frac{Design Allowable Load}{Design Limit Load x FoS} - 1 > 0$$

- Factors of Safety (ECSS-E-ST-32-10C)
- Load may replaced by stress
- Significance MoS values (not mentioned in ECSS-E-ST-32C)

MoS < 0 Failure

0 < MoS £ 0.5 Optimal design

0.5 < MoS £ 1.5 Good design

MoS > 1.5 Design can be easily improved

Space engineering

ECSS-E-ST-32-08C 31 July 2008

Materials

Allowable Loads or Stresses

- Metals
- Non-metallic materials
 - Glass & ceramics
 - Non Metallic materials other than Glass & Ceramics
- Composite Materials
- Adhesive materials in bonded joints

Design Allowable

- For structural material, design allowable shall be statistically derived covering all operational environments
- The scatter bands of the data shall be derived and design allowable defined in terms of fractions of their statistical distribution with Abasis or B- basis specified levels of reliability and confidence
- For each type of test the minimum number of test specimens shall be:
 - a. ten (10) to establish A- values, and
 - b. five (5) to establish B- values.
- ❖ If the material is delivered in several batches, the design allowable test program shall evaluate the variations from batch to batch by performing sample tests at regular intervals during the production sequence.

Definitions A- and B-Value

- A-basis design allowable (A-value)
 - mechanical property value above which at least 99 % of the population of values is expected to fall, with a confidence level of 95 %
- B-basis design allowable (B-value)
 - mechanical property value above which at least 90 % of the population of values is expected to fall, with a confidence level of 95 %

Metals

- All design allowable for metals shall be defined by their A- values.
- ❖ For unpressurized metal structures, B- values may be used in redundant structure in which the failure of a component can result in a safe redistribution of applied loads to other load-carrying structures.
- All other metal material properties shall be defined by average values.

Glass & Ceramics

Design allowable for glass and ceramics shall be derived through a probabilistic approach, covering all size effects

Non-Metallics other than Glass & Ceramics

- Design allowable for other non- metals, (stress or strain) shall be defined by their A- values.
- For unpressurized non- metallic structures, B- values may be used in redundant structure in which the failure of a component can result in a safe redistribution of applied loads to other load-carrying structures
- ♦ The material properties other than those specified shall be defined by average values.

Composite Materials

- All design allowable for composite materials (stress or strain) shall be defined by their A- values.
- ❖ For unpressurized structures in composite materials, B- values may be used in redundant structure in which the failure of a component can result in a safe redistribution of applied loads to other load carrying structures.
- All the material properties other than those specified shall be defined by their average values.

Adhesive Materials in Bonded Joints

All design allowable for adhesive materials in bonded joints (stress or strain) shall be defined according to standards agreed with the customer.

Design of Structures (2)

- Structural General Requirements ECSS-E-ST-32C Rev. 1, 15/11/2008
- Materials (see ECSS-E-ST-32-08C)
- Processes (see ECSS-E-ST-32C)
- Assembles (see ECSS-E-ST-32C)
- Joints (bolts, bonding, welding, soldering, brazing)

Materials

1. Materials, ECSS-E-ST-32-08C Rev. 1, 21/7/2008

- ECSS-E-ST-32-08 defines the mechanical engineering requirements for materials. This Standard also encompasses the mechanical effects of the natural and induced environments to which materials used for space applications can be subjected.
- This Standard defines requirements for the establishment of the mechanical and physical properties of the materials to be used for space applications, and the verification of these requirements.
- Verification includes destructive and non-destructive test methods. Quality assurance requirements for materials (e.g. procurement and control) are covered by ECSS-Q-ST-70.
- This standard may be tailored for the specific characteristics and constrains of a space project in conformance with ECSS-S-ST-00.

Structural Material Selection

Material	ho (kg/m ³)	E (GPa)	Fty (MPa)	Ε/ρ	Fty/ρ	α (μm/m K °)	κ (W/m K°)

Finite Element Analysis (Cont'd)

- The elastic-dynamic behavior of structural elements (rod, beam, plate, cylinder,) can be described with the aid of partial differential equations (PDE). PDE are difficult to solve.
- The PDE's can be converted into sets of linear equations applying variational methods in combination of assumed functions (shapes); Theorem of minimum potential and complementary energy, Rayleigh-Ritz method, Galerkin method, ... The finite element method is based on variational techniques and is the major numerical analysis method.
- The finite element method requires division of the problem into many subdomains and each domain is called a finite element. The problem domain consists of may elements.
- The set of many linear equations is solved by numerical schemes on very high performance computers (Gauss elimination, Cholesky decomposition, ...)
- The Finite Element method Using MATLAB, Kwon, Y.W., Bang, H. CRC Press, 2000, ISBN 0-8493-0096-7

Finite Element Analysis, NAFEMS (Cont'd)

NAFEMS is an independent not-forprofit body with the sole aim of promoting the effective use of engineering simulation methods such as finite element analysis, multibody system dynamics and computational fluid dynamics.

FEA Buckling Analysis

Buckling of Structures, ECSS-E-HB-32-24A

Space engineering

Buckling of structures

- Not stable equilibrium of a structure under loads applied statically or dynamically
- Linearized Pre-buckling/Bifurcation analysis
- Nonlinear Pre-buckling/Bifurcation Analysis

Buckling

- The stability (i.e. no buckling) of the structure shall be verified for the design loads.
- Local buckling shall be prevented unless:
 - the buckling is reversible, and
 - the resulting stiffness and deformations still conform to the structural and functional requirements, and
 - a post- buckling investigation (by analysis or test) demonstrates positive margins against failure.

Buckling Analysis

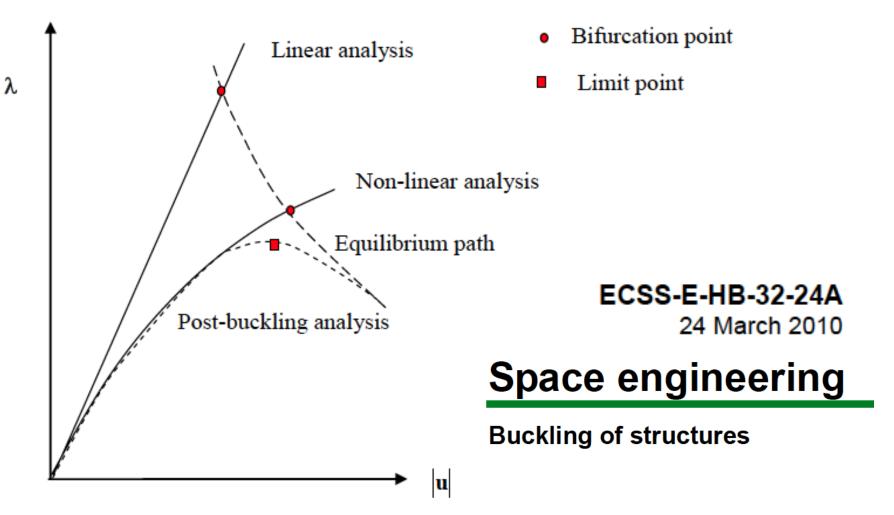

- Buckling analysis shall be used to predict the loads at which the onset of structural instability occurs.
- For cases where elastic fully reversible buckling is accepted, post- buckling behavior shall be analyzed.
- Effects on stability of boundary conditions, defects and geometrical imperfections in the structure shall be included in the buckling analysis.

NOTE Geometrical imperfections refer to any deviation from the nominal shape including effect due to assembly tolerances.

Post-Buckling Analysis

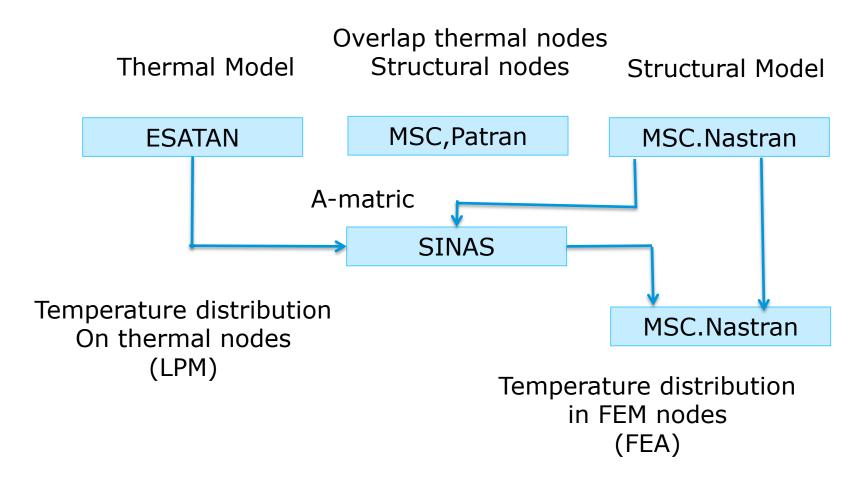

Thermal Load Analysis

- Thermal Analyzer (ESATAN, ESARAD, ...)
- Temperature interpolation (PAT)
- Thermal Distortions/stress (FEA) (Thermal distortions on-orbit)
- Constraints imposed by the thermal design and impacting the structure shall be identified.
- ❖ The temperatures and temperature variations and gradients during all phases of a mission, including manufacturing and storage, shall be used, both in the material selection and in the design in order to achieve the specified functional and structural performance.

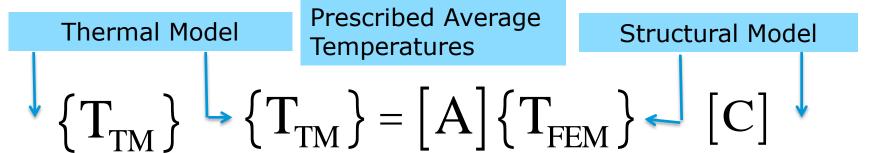

Prescribed Average Temperatures Temperature interpolation

Prescribed Average Temperatures Temperature interpolation (Cont'd)

Temperature interpolation

Sloshing Effects

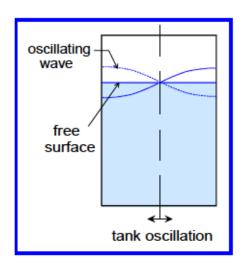

The structure shall be verified against the effects of the interaction with fluids (e.g. sloshing, POGO, cavitation effects and pressure fields).

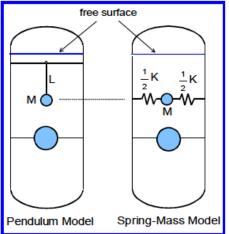

Fluid Structure Interaction (FSI) In fluid dynamics, **slosh** refers to the movement of liquid inside another object (which is, typically, also undergoing motion). Strictly speaking, the liquid must have a free surface to constitute a **slosh dynamics** problem, where the dynamics of the liquid can interact with the container to alter the system dynamics significantly. Important examples include propellant slosh in spacecraft tanks and rockets (especially upper stages), and cargo slosh in ships and trucks transporting liquids (for example oil and gasoline). However, it has become common to refer to liquid motion in a completely filled tank, i.e. without a free surface, as "fuel slosh"

Overview of Sub-Course E-32 Structures

- 1. General introduction to Structural Verification Cycle
- Load types and derivation (steady state, low frequency dynamics, high frequency acoustics and structure born vibrations, shock, thermal, constraints, micro-vibrations, ...)
- 3. Development Approach (prototype, proto-flight, STM, ...)
- 4. Design of Structures (material, processes, assembles, joints, allowable stress/load, ...)
- 5. Mechanical Analysis (models, validation, static dynamic, acoustic, stability, thermo-elastic, micro-vibrations, sloshing, system, subsystem)
- **6.** Damage Tolerance (hardware inspection, analytical verification, specific testing, ...)
- 7. Testing (static, modal, sine, acoustic, random, thermal, micro-vibrations, pressures, ...)
- 8. Structural requirements flow down
- Mechanical Interfaces (Handbooks)

Space engineering

Spacecraft loads analysis

ECSS-E-HB-32-26 TBD Issue Date

Chapter 12

Fatigue & Fracture Control

Fracture control and fatigue life verification of spacecraft, launchers and their payloads and experiments is of paramount importance for the safety and reliability of manned and unmanned space operations.

Damage Tolerance

❖ Damage tolerance capability of a structure to resist failure due to the presence of flaws, cracks, or other damage for a specified period of usage without inspection or repair.

Damage Tolerant

Characteristic of a structure for which the amount of general degradation or the size and distribution of local defects expected during operation, or both, do not lead to structural degradation below specified performance

Fatigue Analysis

- Fatigue analysis shall be performed to verify that fatigue defect (crack or delamination) initiation or propagation resulting in structural failure or functional degradation cannot occur throughout the service life of the structure.
- Effects of stress concentrations shall be included in the analysis.
- The life of the structure shall be verified for the specified service life multiplied by the specified scatter factor considering the most unfavorable load sequence within each event.
- Design limit loads (multiplied by factors of safety specified by the customer for fatigue) shall be used for fatigue analysis.
- Alternate, permanent, and acoustic loads and their combination and sequence shall be used to perform the fatigue analysis.

Fracture Control

❖ For fracture control analysis requirements, see standard Fracture Control ECSS-E-ST-32-01C Rev. 1, 6/3/2009.

Verification by Test

Space engineering

Testing

ECSS-E-ST-10-03C Draft 12.5 4 March 2011

- Qualification and Acceptance Testing
- Static test
 - Thermal-Stress test (Difficult to perform)
 - Pressure test
- Dynamic test
 - Modal survey test
 - Sine and Random tests on shaker
 - Notching (Primary & Secondary) to prevent over-testing
 - Acoustic in reverberant chamber
 - Shock test
 - Micro-vibration test

Qualification & Acceptance Test

Qualification

- Qualification tests shall be performed to verify that the structure design and manufacturing technique fulfill specification requirements.
- Qualification test shall account for the worst hardware characteristics which can be present in a flight unit but are not present in the test unit (e.g. by means of dedicated correction factors).

Acceptance

Acceptance tests shall be performed on the flight hardware.

Test Factors, Rate and Duration (e.g. Soyuz)

,	Qualification*		Protoflight		Acceptance	
S/C tests	Factors	Duration/Rate	Factors	Duration/Rate	Factors	Duration/Rate
Static (QSL)	1,25	N/A	1,25	N/A	N/A	N/A
Sine vibrations	1,25	2 oct/min	1,25	4 oct/min	1.0	4 oct/min
Acoustics	+3 dB (or 2)	120 s	+3 dB (or 2)	60 s	1.0	60 s
Shock	+3 dB (or 1.41)	N/A	+3 dB (or 1.41)	N/A	N/A	N/A

- Spacecraft qualification and Acceptance test levels are determined by increasing the flight limit loads. The spacecraft must have positive margins of safety for yield and ultimate loads
- Qualification by analysis factor of safety of 2.0 and MoS>1

European Space Agency

Modal survey assessment

Modal Survey (Modal Analysis) Test

- General objectives and requirements
- Modal Survey test procedures
- Pre-test Analysis
- Annex A Excitation signals
- Annex C Estimation methods for modal parameters
- Annex C Modal Test-Mathematical Model verification checklist

Space engineering

Structural general requirements

Dynamic Tests: Sine, Random, Shock

- Dynamic tests (sine, random, shock) shall be performed to verify:
 - the dynamic behavior, in terms of accelerations and interface forces (including units and appendages)
 - the compliance to the stiffness requirements, and
 - the strength and alignment stability under dynamic loads.

Sine Vibration Test (A5 User's Manual)

Sine	Frequency	Qualification	Protoflight	Acceptance
	range (Hz)	levels (0-peak)	levels (0-peak)	levels (0-peak)
Longitudinal	2-5*	12.4 mm	12.4 mm	9.9 mm
	5-50	1.25 g	1.25 g	1 g
	50-100	1 g	1 g	0.8 g
Lateral	2-5	9.9 mm	9.9 mm	8.0 mm
	5-25	1 g	1 g	0.8 g
	25-100	0.8 g	0.8 g	0.6 g
Sweep rate		2 oct./min	4 oct./min	4 oct./min

^{*} Pending on the potential limitations of the manufacturer's test bench, the fulfillment of the requirement in that particular frequency range can be subject to negotiation in the field of a request for waiver process, and providing that the S/C does not present internal modes in that range.

Test duration (s)

$$T = \frac{86.6}{n} \ln \zeta \frac{f_{\text{max}} \ddot{0}}{\dot{f}_{\text{min}} \ddot{0}}$$

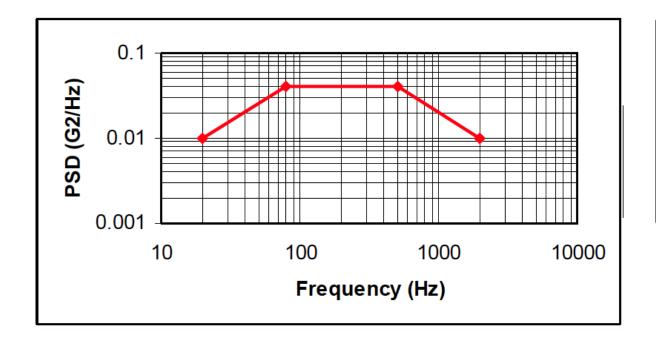

n is sweep rate (Oct/min)

f_{max} maximum frequency (Hz)

f_{min} minimum frequency (Hz)

Random Vibration Test (Example of levels, NASA-ST-7001)

Frequency	PSD	
(Hz)	(G2/Hz)	
20	0.01	
80	0.04	
500	0.04	
2000	0.01	
Composite	6.8 Grms	

Slope between 20-80 Hz 3dB/oct SLope between 500-2000 Hz -3dB/oct Time duration e.g. Qualification 120 s

Notching

- Modification of sine or random vibration test spectrum
- Notching based on QSL
- Force limiting

Notching

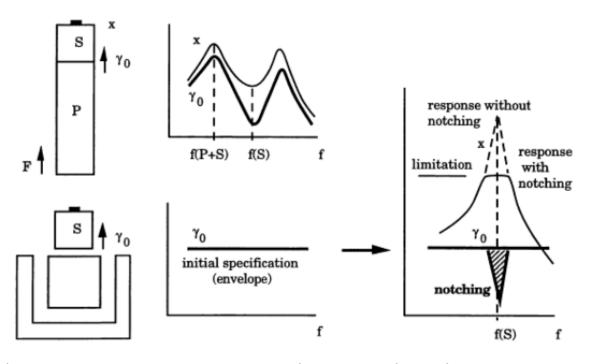

- Based on QSL
 - The primary notching applies to the primary structure compared with the quasi static loads.
 - The secondary notching applies to the equipment when we consider a satellite or structural elements when we perform a test on an instrument or an equipment.
- Force Limited
 - Semi-Empirical

 $W_{FF}(f)$ Interface force PSD

Frequency

Natural frequency (first significant mode)

Space engineering

Structural general requirements

Acoustic Noise Test

- ♦ Acoustic tests shall be performed to verify:
 - ♦ The ability of the structure and its equipment to withstand the vibrations induced by the specified acoustic field.
 - ♦ The random dynamic design environment for subsystems and equipment.

Acoustic Noise Test

Acoustic vibration test levels (A5 User's manual)

Octave band centre frequency	Qualification Level (dB)	Protoflight Level (dB)	Acceptance level (flight) (dB)
(Hz)	ref: 0 dB = 2 x 10 ⁻⁵ Pascal		
31.5 63 125 250 500 1000 2000	131 134 139 136 132 126 119	131 134 139 136 132 126 119	128 131 136 133 129 123 116
Overall level	142.5	142.5	139.5
Test duration	2 minutes	1 minute	1 minute

Fill factor

Special consideration shall be given to spacecraft which fill factor, calculated as the ratio of the maximum horizontal cross area of spacecraft including its appendages solar panels and antennae over the fairing is greater than 60 %.

Fill factor	0 to 60 %	60% to 85%	85%
Fill factor correction	0 %	Linear interpolation	100 %

100 % of fill factor correction corresponds to +4 dB at 31.5 Hz and + 2 dB at 63 Hz.

TOLERANCES

- -2, +4 dB for 31.5 Hz band
- -1, +3 dB for following bands

- 7. Testing (static, modal, sine, acoustic, random, thermal, micro-vibrations, pressures, ...)
- 8. Structural requirements flow down
- 9. Mechanical Interfaces (Handbooks)

Structural Requirements Flow Down

- Requirements specified in Launch Vehicle Manual on Spacecraft
- * Requirements flow down from system to subsystems
 - Stiffness
 - Loads
 - Interfaces
 - **...**

Stiffness

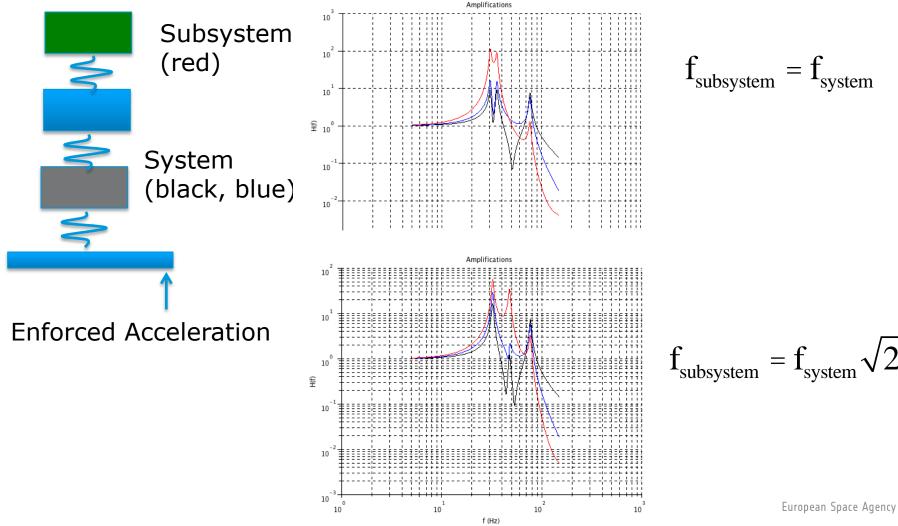

- Subsystem regarding system
 - Fixed interface
 - $\ \ \,$ The lowest natural frequency requirement of the subsystem is $f_{\text{subsystem}} \ ^3 f_{\text{system}} \sqrt{2}$ with associated significant modal effective mass to prevent vibration absorber effect

Examples

- System is spacecraft, subsystem is solar wing
- System is spacecraft, subsystem is instrument
- System is instrument, subsystem electronics box mounted to instrument
- **....**

Stiffness (Cont'd)

Flow Downs of Loads

- Flow down of mechanical loads fom system to subsystem
- Static Loads
 - Limit loads (e.g. Mass Acceleration curve)
- Dynamic Loads
 - Enveloping sine vibration specification (potential overtesting)
 - Enveloping random vibration specification (potential overtesting)
 - Acoustic environment (System requirements) $\frac{A}{m} = 0.215$ $\frac{e^{t} m^{2}}{e^{t} kg}$
 - Shocks (system requirements)
 - **....**

Joining methods for space structures

- Welding (alloys or thermoplastics), Soldering, Grazing
- Mechanical fastening
- Adhesive bonding
- * A combination of both bonding and mechanical fastening.

Space engineering

ECSS-E-HB-32-21A 20 March 2011

Adhesive bonding handbook

Adhesive handbook

This handbook is an acceptable way of meeting the requirements of adhesive materials in bonded joints of ECSS- E- ST- 32C.

Adhesive Bonding Aspects

Successful joining by adhesive bonding needs consideration of a large number of factors which influence the:

- design of the whole structure,
- design of the component parts of the structure,
- design of the joints between components of the structure,
- material selection,
- manufacturing, and
- inspection and maintenance.

It is therefore necessary to adopt a fully- integrated design and materials selection process. This point is emphasized throughout this handbook. Nonetheless, adhesive bonding is a tried and proven technique within aerospace industries, resulting from many years of research, development and analytical activities leading to practical implementation

Types and Geometry Adhesive Bonded Joints

Space engineering

Adhesive bonding handbook

ECSS-E-HB-32-21A 20 March 2011

-	JOINT TYPE	COMMENTS		JOINT TYPE	COMMENTS
	Simple	Simplest bonded joint, but suffers from offset load path with associated stress concentration and peel.		Single	Similar principle to single lap joint. Bending and peel experienced due to stiffness mismatch and central discontinuity in adherends.
Single Lap Joints	Taper or Recelled	Tapers reduce stress concentration.	Strapped Joints	Double	Similar principle to double lap joint. Reduces bending and peel seen with single strap. Central discontinuity in adherends.
	Radiused	Radii reduce stress concentration.		Bevelled	Revela rechner stress concentration.
	Double Step	Minimises joint weight but lowers joint strength due to discontinuity in laminate.		Radiused	Radii reduce stress concentration.
	Rebated or Joggle	Alignment of adherends to avoid offset load path, but 'kink' may compromise strength.		Recessed Double	Discontinuity between strap and adherends, plus central discontinuity between adherends. Thinning of adherends to accept recesses straps reduces strength
	Stepped	Discontinuity in laminate (see Double Step).	Stepped Lap	Simple	Increased bond area. Discontinuity at external edges plus at ends of internal steps.
oints	Simple	Eliminates majority of bending and peel stresses found with single simple overlap.	Steppe	Revenued	As above, but recessing creates smooth external surface.
Double Lap Joints	Bevelled	Bevels reduce stress concentration.		Single Taper	Increased bond area. Avoids discontinuities in stepped lap geometry.
	Radiused	Radii reduce stress concentration.	Searf	Double Taper	Increased bond area compared to single taper.
Bonded Doublers	Single Sided	Provides localised thickening and stiffening. Similar transfer in bond to simple single lap.	Sea	Increased Thickness Scarf	Increased bond area. Thicker adherends in bond area increase strength of joint zone.
Bonded	Double Sided	Provides localised thickening and stiffening. Similar transfer in bond to simple double lap.		Landed Scarf	Increased bond area, but discontinuity at lands.
