

Space engineering

Explosive subsystems and devices

This draft is distributed to the ECSS community for Public Review. Duration of the Public Review, as per TA#54 decision: 3 weeks **Review comments may only be made to the modified parts of the document.** NOTE: This version identifies all deletions only with a revision bar.

> Start of Public Review: 28 September 2016 End of Public Review: 21 October 2016

DISCLAIMER (for drafts)

This document is an ECSS Draft Standard. It is subject to change without any notice and may not be referred to as an ECSS document until published as such.

ECSS Secretariat ESA-ESTEC Requirements & Standards Division Noordwijk, The Netherlands

Foreword

This Standard is one of the series of ECSS Standards intended to be applied together for the management, engineering and product assurance in space projects and applications. ECSS is a cooperative effort of the European Space Agency, national space agencies and European industry associations for the purpose of developing and maintaining common standards. Requirements in this Standard are defined in terms of what shall be accomplished, rather than in terms of how to organize and perform the necessary work. This allows existing organizational structures and methods to be applied where they are effective, and for the structures and methods to evolve as necessary without rewriting the standards.

This Standard has been prepared by the ECSS-E-ST-33-11C Rev.1 WG Working Group, reviewed by the ECSS Executive Secretariat and approved by the ECSS Technical Authority.

Disclaimer

ECSS does not provide any warranty whatsoever, whether expressed, implied, or statutory, including, but not limited to, any warranty of merchantability or fitness for a particular purpose or any warranty that the contents of the item are error-free. In no respect shall ECSS incur any liability for any damages, including, but not limited to, direct, indirect, special, or consequential damages arising out of, resulting from, or in any way connected to the use of this Standard, whether or not based upon warranty, business agreement, tort, or otherwise; whether or not injury was sustained by persons or property or otherwise; and whether or not loss was sustained from, or arose out of, the results of, the item, or any services that may be provided by ECSS.

Change log

ECSS-E-30 Part 6A	First issue	
25 April 2000		
ECSS-E-33-11A	Second issue	
17 April 2008	 Changes to the previous version are: the use of the more accurate term "explosive" rather than "pyrotechnics" in relation to the subject components and systems; the emphasis on reliability coupled with confidence level for performance properties; the inclusion of detailed requirements for the different types of explosive device; and the emphasis on the requirement for properties of components to be agreed with the end user before commitment to purchase. 	
ECSS-E-33-11B	Never issued	
ECSS-E-ST-33-11C	Third issue_	
31 July 2008	Editorial changes.	
ECSS-E-ST-33-11C Rev.1 DIR1 7 October 2015	Third issue, Revision 1: – Draft for Pyro Expert Review	
ECSS-E-ST-33-11C Rev.1 DIR2	Third issue, Revision 1:	
27 September 2016	Changes with respect to the previous version are identified with revision tracking. (TO BE COMPLETED BEFORE PUBLICATION) Main changes are: • _xxx Added requirements: Modified requirements: Deleted requirements:	
	Editorial corrections:

Introduction

As any explosive item used for flight can function only once, it can never be fully tested before its crucial mission operation. The required confidence can only be established indirectly by the testing of identical items. Test results and theoretical justification are essential for demonstration of fulfilment of the requirements. The requirement for repeatability shows that product assurance plays a crucial role in support of technical aspects.

The need for statistics requires that the explosive components used in the explosive <u>subsystem</u> be tested and characterized extensively. The variability in components requires that manufacturers prove to customers that delivered items are identical to those qualified.

The failure or unintentional operation of an explosive item can be catastrophic for the whole mission and life threatening. Specific requirements can exist for the items associated with it. As all explosives where ever used are treated similarly, the same requirements, regulations, practices and standards need to be applied <u>to</u> help avoid human error.

1 Scope

This Standard defines the requirements for the use of explosives on all spacecraft and other space products including launch vehicles. It addresses the aspects of design, analysis, verification, manufacturing, operations and safety.

This standard may be tailored for the specific characteristics and constraints of a space project in conformance with ECSS-S-ST-00.

2 Normative references

The following normative documents contain provisions which, through reference in this text, constitute provisions of this ECSS Standard. For dated references, subsequent amendments to, or revision of any of these publications, do not apply. However, parties to agreements based on this ECSS Standard are encouraged to investigate the possibility of applying the more recent editions of the normative documents indicated below. For undated references, the latest edition of the publication referred to applies.

	or launcher subsystems and Transfer Vehicle

For launcher subsystems and Transfer Vehicle programs, the specific General Specification (SG) or Design Rules (DR) documents are applicable for designing, dimensioning and testing.

3 Terms, definitions and abbreviated terms

3.1 Terms defined in other standards

- a. For the purpose of this Standard, the terms and definitions from ECSS-S-ST-00-01 apply, in particular for the following terms:
 - 1. lifetime

3.2 Terms specific to the present standard

3.2.1 all fire

stimulus with a probability of functioning equal to or better than 0,999 at 95 % confidence level

3.2.2 armed

status of an explosive subsystem when all the safety devices have been disabled and which is able to trigger

[Dictionary of explosive related terms]

3.2.3 cartridge

explosive device designed to produce pressure for performing a mechanical function

NOTE A cartridge is called an initiator if it is the first or only explosive element in an **explosive train** (see definition 3.2.13).

3.2.4 charge

explosive loaded in a cartridge, detonator, or separate container for use in an explosive device

3.2.5 component

smallest functional item in an explosive subsystem

3.2.6 deflagration

self-sustaining, exothermic decomposition reaction of an explosive substance, whose apparent velocity is less than the velocity of sound in the substance and greater than the speed of sound in air

NOTEIt is generally accepted that the energy transmission
takes place via a mechanical compression wave. This
type of reaction is intermediary between combustion
and detonation. It differs from combustion through
the presence of a significant compression wave in the
surrounding environment.

[Dictionary of explosive related terms]

3.2.7 detonation

exothermic decomposition reaction of an explosive substance self-sustained by a shock wave, whose velocity of propagation is greater than the velocity of sound in the substance

<u>NOTE</u> The velocity of propagation is of the order of several thousands of m/s.

[Dictionary of explosive related terms]

3.2.8 detonator

initiator whose function is to transform external energy directly into a shock wave strong enough to detonate a secondary high explosive

NOTE External energy can be, for example, mechanical, electrical and thermal.

[Dictionary of explosive related terms]

3.2.9 electro-explosive device

device containing some reaction mixture that is electrically initiated

NOTE 1 The output of the initiation is heat, shock or mechanical action.

NOTE 2 The reaction mixture can be explosive or pyrotechnic.

[Dictionary of explosive related terms]

3.2.10 end-user

person who or organization that actually uses a product

- NOTE 1 The end-user need not to be the owner or buyer.
- NOTE 2 In the context of this standard the end user is generally the first level customer.

3.2.11 energetic material

material consisting of, or containing, an explosive, oxidizer, fuel, or combination of them, that can undergo, contribute to, or cause rapid exothermic decomposition, combustion, deflagration, or detonation

3.2.12 explosively actuated device

<u>device</u> that converts the products of explosion into useful mechanical work

- NOTE 1 The explosion can be combustion, deflagration or detonation.
- NOTE 2
 Pyromechanisms and linear detonating separation

 devices are explosively actuated devices.

3.2.13 explosive train

series of explosive components including the initiator, explosive transfer assembly and explosive actuator

3.2.14 explosive component

discrete item containing an explosive substance

3.2.15 explosive function

function that uses energy released from explosive substances for its operation

3.2.16 explosive subsystem

collection of all the explosive trains on the spacecraft or launcher system, and the interface aspects of any on-board computers, launch operation equipment, ground support and test equipment and all software associated with explosive functions

3.2.17 fail operational

mission capable after a failure

3.2.18 fail-safe

design property of a subsystem, or part of it, which remains safe after one failure

NOTEMaintained safety following two independent failuresis referred to as "Fail safe – Fail safe"

3.2.19 gas generators

explosive devices that produce a volume of gas or exothermic output or both

NOTE E.g. pyrotechnic igniters for solid propulsion applications, gas generator for inflatable structures.

3.2.20 initiator

<u>basic component located upstream of an explosive train, from which originates a</u> <u>transformation of mechanical, electrical or optical energy, the effect produced being a</u> <u>combustion, deflagration or detonation.</u>

- NOTE 1 <u>It contains a small quantity of an energetic material</u>.
- NOTE 2 <u>Examples: hot bridge wire initiator, exploding bridge</u> <u>wire initiator</u>

3.2.21 limit testing

testing to establish the limit of a performance characteristic of a component

3.2.22 lot

group of components produced in homogeneous groups and under uniform conditions

NOTE A batch is the same as a lot.

3.2.23 lot acceptance

demonstration by measurement or test that a lot of items meets requirements

3.2.24 no fire

stimulus with a probability of functioning equal to or less than 0,001 at 95 % confidence level

3.2.25 packaged charge

explosive material in a closed container

3.2.26 pyrotechnic device

<u>a basic pyrotechnic object containing explosive substances and intended to perform an</u> <u>initiation (ignition, priming), pyrotechnic effect transmission, amplification or</u> <u>generation function</u>

[Dictionary of explosive related terms]

3.2.27 pyromechanism

<u>device intended to perform one or more mechanical actions, using the energy</u> <u>produced by the reaction of a energetic material</u>

[Dictionary of explosive related terms]

3.2.28 safe

condition that renders the probability of an unwanted event below an agreed limit

3.2.29 secondary characteristic

any characteristic other than the function

3.2.30 sequential firing

application of the firing pulses to initiators separated in time

3.2.31 success

simultaneous achievement by all characteristics of required performance

3.2.32 sympathetic firing

firing of other explosive devices due to the output of any other

3.2.33 transfer line

linear explosive assembly for propagation of deflagration or detonation

3.2.34 through-bulkhead initiator (TBI)

relay which provides transition between the detonation of a transmission line and the combustion of an ignition charge, through a sealed bulkhead[Dictionary of explosive related terms]

<u>NOTE</u> The bulkhead remains tight after functioning under the specified environment, e.g. pressure and temperature.

3.3 Abbreviated terms

For the purpose of this Standard, the abbreviated terms from ECSS-S-ST-00-01 and the following apply:

Abbreviation	Meaning
DC	direct current
DMPL	declared materials and processes list
DSC	differential scanning calorimetry
DR	design rules
DTA	differential thermal analysis
EED	electro-explosive device
EMC	electromagnetic compatibility
EMI	electromagnetic interference
ESD	electrostatic discharge
FOSU	ultimate design factor of safety
FOSY	yield design factor of safety
<u>GDIR</u>	general design and interface requirement
GSE	ground support equipment
<u>GTPS</u>	Groupe de Travail de Pyrotechnie
ICD	interface control document
МЕОР	maximum expected operating pressure
N/A	not applicable
NC	normally closed
NO	normally open
RF	radio frequency
<u>SDS</u>	Safety Data Sheet
<u>SG</u>	general specification
SRS	shock response spectrum
ТВІ	through-bulkhead initiator
ТВРМ	to be provided by manufacturer
ТВРС	to be provided by customer
<u>TBPU</u>	to be provided by user
TGA	thermo <u>gravimetric</u> analysis
VTS	vacuum thermal stability

3.4 Symbols

@	at
g	standard surface gravity (9,80665 m/s ²)
h	drop height (m)

Μ	mass of drop weight (kg)

- σ standard deviation
 - Ampere
- V Volt

Α

3.5 Nomenclature

The following nomenclature apply throughout this document:

- a. The word "shall" is used in this standard to express requirements. All the requirements are expressed with the word "shall".
- b. The word "should" is used in this standard to express recommendations. All the recommendations are expressed with the word "should".

<u>4It is expected that, during tailoring, all the recommendations in</u> <u>this document are either converted into requirements</u> <u>or tailored out.</u>

- c. The words "may" and "need not" are used in this standard to express positive and negative permissions respectively. All the positive permissions are expressed with the word "may". All the negative permissions are expressed with the words "need not".
- d. The word "can" is used in this standard to express capabilities or possibilities, and therefore, if not accompanied by one of the previous words, it implies descriptive text.

<u>NOTE</u> In ECSS "may" and "can" have a complete different meaning: "may" is normative (permission) and "can" is descriptive.

e. The present and past tense are used in this standard to express statement of fact, and therefore they imply descriptive text.

5 Requirements

5.1 General

5.1.1 Overview

Being generally applicable, the requirements stated in this <u>clause</u> apply throughout and are not repeated in the <u>clauses</u> relating to specific topics.

Explosive <u>subsystem</u> and devices use energetic materials (explosives, propellants, powder) initiated by mechanical, electrical, thermal, or optical stimuli, for unique (single shot) functions e.g. solid booster initiation, structure cutting, stage distancing, pressurized venting, stage neutralisation, valve opening or closing, release of solar arrays, antennas, booms, covers and instruments.

The properties of the initiator govern the major part of the behaviour of the subsystem.

The requirements for initiators and their derivatives, such as cartridges and detonators, are defined in specific requirements related to the specific types.

Properties of explosive components and <u>subsystem</u>, which cannot be covered by requirements for the initiators alone, are defined in specific requirements relating to the types of <u>explosively actuated device or pyromechanisms</u>.

Other components of the explosive <u>subsystem</u>, which can be tested and do not need specific requirements, are subject to the general technical and product assurance requirements. Detailed aspects of these components are included where they have a significant influence on the success of the system.

Single-shot items can never be tested in advance. Particular care is needed in their development, qualification, procurement and use. Explosive components are not governed by the institutional component control organisations.

The content and phasing of deliverable documents are identified in each of the top level discipline standards of each ECSS branch. A list of deliverable documents specific to this standard is provided in informative Annex B.

5.1.2 Properties

- a. The two states of the properties of the explosive <u>subsystem</u> before firing and after firing shall be identified and listed.
- b. For every explosive component the function, primary stimulus, unwanted stimuli and secondary characteristics shall be identified and quantified.

- c. Only qualified and lot accepted items shall be used in flight systems.
- d. The properties of <u>an explosive subsystem</u> shall remain stable over time before firing and after firing when subject to external loads or environmental conditions, within the qualification values.

5.2 Design

5.2.1 General

- a. In case of redundancy, no component shall adversely affect its substitute.
- b. The system lay-out should facilitate the replacement of subsystems or components.
- c. Parts of the explosive <u>subsystem</u> and devices identified as critical on the basis of a RAMS analysis shall be replaceable.
- d. Replaceable parts shall be listed in the User's Manual of the explosive <u>subsystem</u> and devices.

5.2.2 Reliability and confidence

- a. The explosive <u>subsystem</u> shall achieve the specified properties within <u>the</u> <u>required</u> reliability and confidence <u>level defined at system level</u>.
- b. The reliability <u>demonstration</u> shall be: .
 - <u>1. used to justify design margins including the influence of ageing,</u> <u>temperature and explosive batch,</u>
 - 2. justified according to clause 6.4.2 ECSS-Q-ST-30 or dedicated system specification, and
 - 3. stated in a reliability prediction document as per Annex E of ECSS-Q-ST-30.

<u>NOTE</u> <u>Dedicated system specifications are, for example,</u> <u>GDIR and SG.</u>

c. The <u>allocation of the probability and the</u> confidence level <u>of unwanted actuating</u> <u>an explosive device shall be determined and justified according to clause 7.5 of</u> <u>ECSS-Q-ST-40 or dedicated system specification</u>.

> <u>NOTE</u> <u>Dedicated system specifications are, for example,</u> <u>GDIR and SG.</u>

- d. <u><<deleted>></u>
- e. <u><<deleted>></u>
- f. <u>For the reliability demonstration, the customer shall agree</u> which performance characteristics <u>are</u> declared as mean values with associated standard deviation.

<u>NOTE</u> The reliability demonstration is used to justify design margins including the influence of ageing, temperature and explosive batch.

g. <u>The selection</u> of the statistical methods <u>and functional parameters shall be</u> justified and approved by the customer.

5.2.3 Performance

a. Except as specified in 5.2.3b, all performance shall be quantified by measurement versus time of initial, transitional, and final values of the specified properties.

NOTE Specified properties are listed in clauses 5.11 and 5.12.

b. The time interval specified in 5.2.3a shall be measured between <u>a clear</u> reproducible initiation event and the attainment of the performance value.

<u>NOTE</u> For example, the initiation event and 90 % of the maximum pressure value in a closed bomb.

c. <u><<deleted>></u>

d. The basis of the time shall be specified and justified.

5.2.4 Wanted and unwanted response

- a. For wanted response, the response of any component, when subjected to the specified minimum probable stimulus, shall be demonstrated to be more than the specified lower limit agreed between customer and supplier.
- b. For unwanted response, the response of any component, when subjected to the specified maximum possible disturbance, shall be demonstrated to be less than the specified upper limit agreed between customer and supplier.

NOTE This applies to safety and failure.

5.2.5 Dimensioning

5.2.5.1 Strength

- a. The explosive <u>subsystem</u> shall sustain, before, during and after firing:
 - 1. the internal loads due to operation and
 - 2. the external loads defined by the end-user.

NOTE These loads represent the sum of preload, static, dynamic, thermal and any other load seen in service.

5.2.5.2 Integrity

- a. The explosive <u>subsystem</u> shall maintain its integrity and position during its lifetime.
- b. Components that are intended not to rupture during operation, when installed into their explosive <u>subsystem</u> interfaces, shall be able to withstand the maximum expected operational loads times a factor FOSU.
- c. The factor FOSU shall be in conformance with Tables 4-3 in ECSS_E_ST_32_10 depending on the material used.
- d. Deformation of any component shall not:
 - 1. reduce its specified performance,
 - 2. affect any part of the system,

- 3. cause leakage more than the specified limit,
- 4. cause debris more than the specified limit.
- e. The factor FOSY shall be in conformance with Table 4-3 in ECSS-E-ST-32-10 depending on the material used.

5.2.5.3 Explosive charge sizing

a. <u>The</u> methodology for dimensioning <u>the explosive charge of the explosive</u> devices shall be justified <u>and be done by testing or modelling at the worst case</u> <u>conditions</u>.

<u>NOTE</u> Worst case conditions include temperature , ageing, radiations effects.

- b. A "margin policy" factor KMP shall be:
 - 1. defined,
 - 2. justified,
 - 3. applied.
 - NOTE 1 This factor, used to give confidence to the design, covers (not exhaustive list):
 - The lack of knowledge on the failure modes and associated criteria.
 - The lack of knowledge on the effect of interaction of loadings.
 - The non-tested zones.
 - NOTE 2 Justification can be performed based on relevant historical practice, analytical or experimental means.

NOTE 3 KMP can have different values according to the explosive materials or device behaviour in the mission profile.

- c. <u><<deleted>></u>
- d. When modelling is performed ,<u>KmP</u> shall <u>include the uncertainty of the model</u>:
 - 1. defined,
 - 2. justified,
 - 3. applied during simulations and analysis.
- e. <u>Depending of the development phase KMP shall include a "project factor"</u> <u>defined according to the uncertainty in the programme level requirement.</u>

<u>NOTE</u> The "project factor" applies during the phase B of the development and becomes equal to 1 after the PDR with the updated technical specification.

- f. <u>KMP shall include an</u> "Explosive factor" for uncertainties on the behaviour of explosive materials in the mission profile and its use configuration.
 - NOTE 1 <u>The uncertainties can be related to ageing, radiations,</u> temperature influence, batch influence, <u>and chemical</u> compatibility, <u>for example material</u>, <u>gases and</u> <u>humidity</u>.

NOTE .2 Use configuration can be, for example, loading density, confinement and thermal exchanges.

g. <u><<deleted>></u>

5.2.5.4 Motorization

a. <u>When a mechanical force or torque is complementary to the explosive energy to</u> <u>achieve a motion in an explosive device, the ECSS-E-ST-33-01, Clause 4.7.5.3</u> shall apply to <u>dimension the actuation force or torque</u>.

NOTE 1 An example of mechanical force or torque is a spring.

NOTE 2 An example of motion is the separation and release of the nut.

5.3 Mission

- a. The use of explosive functions including those for flight termination and range safety during all phases of the mission shall be specified.
- b. The environmental conditions, life cycle and the functions being activated shall be specified.
 - NOTE E.g. ground storage, transport, launcher ignition, staging and safety functions, payload separation, motor ignition, solar array, antenna, boom or cover release, propulsion <u>subsystem</u> branch opening or closing, de-orbiting.
- c. Mission-related requirements placed on the explosive <u>subsystem</u> shall be specified.

5.4 Functionality

- a. The timing of each function of the explosive <u>subsystem</u> shall be specified.
- b. The explosive <u>subsystem</u> shall react only to a specified stimulus and be insensitive to all others.

NOTE Specified stimulus: e.g. nature, range of values.

- c. The explosive <u>subsystem</u> shall ensure that the correct stimulus arrives at the specified place at the specified time.
- d. The explosive <u>subsystem</u> shall prevent the stimulus reaching the initiator at any other time.
- e. Unwanted function or malfunction shall be prevented.
- f. The firing sequence (simultaneous or sequential) shall cause no anomaly.
 - NOTE This applies to secondary characteristics as well as for explosive functions.
- g. Explosive <u>subsystems</u> shall be single-fault tolerant.

- h. Explosive <u>subsystems</u> shall be two fault tolerant, if premature initiation causes a catastrophic failure.
- i. If loss of function is safety critical or catastrophic, the explosive <u>subsystem</u> shall avoid single-point failures and include at least two initiators.
- j. Provision shall be made within the explosive <u>subsystem</u> to protect its components against unwanted operation or degradation.

5.5 Safety

5.5.1 General

- a. The <u>subsystem</u>, including software and procedures, shall be fail safe.
- b. For a catastrophic risk, the explosive <u>subsystem</u> shall be "Fail Safe Fail Safe" or "Fail Operational Fail Safe".
- c. The response of any explosive device to conditions outside the conditions specified shall be reported by the <u>supplier</u> to the end-user.
- d. The explosive subsystem shall only respond to commands intended for that explosive subsystem.

5.5.2 Prevention of unintentional function

5.5.2.1 General

a. The firing pulse shall be prevented from reaching any explosive initiator at any time except the correct instant by means of switchable barriers.

NOTE For example:

- Firing pulse: detonating shock, electrical pulse, and light pulse.
- Switchable barriers: electrical, mechanical, plugs, and pins.
- b. <u>In accordance with the Safety, "Fail Safe Fail Safe" or "Fail Operational Fail Safe" and the reliability requirements, provision</u> shall be made to prevent firing <u>or degradation</u> in response to radio frequency, <u>direct and indirect effect of</u> lightning, magnetic field and electrostatic discharge.
- c. If the explosive <u>subsystem</u> contains two or more barriers then at least two of these barriers shall:
 - 1. be independent,
 - 2. not be subject to common cause failure,
 - 3. each provide complete disconnection of the firing circuit.

<u>NOTE</u> For spacecraft, the electrical architecture of one shot release mechanism lines is designed with the following separated barriers:

- Arming switch,
- Pulse generator,

- Selection switch,
- Satellite separation,
- Interception connector (Safe connector /Safe plug).
- d. For explosive <u>subsystems</u> involving a potential catastrophic risk, the barrier close to the source of the risk shall be a mechanical barrier.
- e. The primary and redundant EEDs shall not be activated through the same electrical firing circuit.
- f. Stray circuits or coupling which can result in unintentional firing shall be avoided.

5.5.2.2 Safe and arm device pre-arm function

- a. The pre-arm function shall be the fourth last in a sequence of functions.
- b. The pre-arm function shall be independent and respond only to a unique action.
- c. The pre-arm function shall remain in its switched state after operation until the fire function has reverted to its initial state.
- d. The pre-arm function may include the select function.
 - NOTE A safe and arm device is not always included.

5.5.2.3 Select function

- a. The select function shall be the third last in a sequence of functions.
- b. The select function shall select the explosive devices.
- c. The select function shall be independent and respond only to a unique command.
- d. The select function shall be used to control only one explosive function.
- e. <u>The select function</u> shall revert to its initial state after the fire command within an interval agreed with the customer.

5.5.2.4 Arm function

- a. The arm function shall be the second-last action in the sequence.
- b. The arm function shall be independent and respond only to a unique command.
- c. The arm function shall be used to control only one explosive function.
- d. The functionality shall be provided to restore its initial disarm<u>ed</u> state after the arm command within an interval agreed with the customer.

5.5.2.5 Fire function

- a. The fire function shall be the last action in the sequence.
- b. The fire function may be used to activate several of explosive devices.
- c. The fire function shall be independent and respond only to a unique command.
- d. The fire function shall revert to its initial state after the firing command within an interval agreed with the customer.

- a. The explosive <u>sub</u>system shall survive the specified sequence of conditions without malfunctioning or degrading beyond the specified limits.
- b. The explosive <u>sub</u>system shall operate between the extremes of the ranges and combinations of specified conditions.
- c. The limits used for the qualification of elements and interfaces shall conform to the specified reliability and confidence.
- d. The end-user shall specify the characteristics of the expected environment.
- e. The end-user shall specify the explosive <u>sub</u>system constraints.
- f. The explosive <u>sub</u>system shall limit the mechanical, electrical and thermal effects of its operation within limits agreed with the end-user to avoid disturbance or damage to other sensitive elements on the space vehicle.
 - NOTE 1 Examples of disturbance are shock, electrical short circuits, and magnetic fields.
 - NOTE 2 For verification and tests see 5.14.

5.7 Interface requirements

5.7.1 Overview

The nature of the interfaces is:

• geometry, including the analysis of the dimensions for all phases of life.

NOTE E.g. assembly, transport, and flight.

- mechanical, including induced loads, static and dynamic;
- fluids, including venting;
- thermal loads;
- electrical, including ensuring electrical continuity and EMC;
- materials, including ensuring compatibility.

5.7.2 Functional

- a. Each interface shall
 - 1. ensure no assembly errors can be made,
 - 2. prevent damage during assembly or dismantling.
- b. Whilst separated, protection shall be provided to each interface.

NOTE This is to prevent activation or damage by external loads and environmental conditions.

c. When closed, each interface shall establish stable continuity of properties between the joined elements.

NOTE This is to prevent disturbance of or being disturbed by external loads and environmental conditions.

- d. Each interface shall sustain without degradation in both coupled and separated states
 - 1. the assembly and dismantling duty-cycle, and
 - 2. the operational and environmental conditions of the application.

5.7.3 Internal

- a. Each element in the explosive <u>subsystem</u> shall be compatible with its neighbour.
- b. Each element shall provide outputs at each interface with margins over the input requirements of the next element or the explosive <u>subsystem</u> output requirements.

NOTE E.g. electrical, mechanical, thermal, and optical outputs.

5.7.4 External

- a. The explosive <u>subsystem</u> shall be compatible with the requirements of all other subsystems on board, external loading, and environmental conditions.
- b. In case 5.7.4a is not met, it shall either:
 - 1. be agreed with the end-user to change the on-board <u>subsystem</u> requirements, or
 - 2. be agreed with the end-user to provide protection against the environmental conditions or to reduce the external loads on the explosive <u>subsystem</u>.

5.8 Mechanical, electrical, and thermal requirements

5.8.1 Mechanical

5.8.1.1 Inertial properties

- a. The supplier, in accordance with the reference axis system provided by the customer, shall provide, before and after firing, the customer with the following information of the component:
 - 1. the mass,
 - 2. the centre of mass,
 - 3. the inertial properties, and
 - 4. the <u>interface FEM in STEP or IGES format</u>.

5.8.1.2 Main fixings

a. Each element of the explosive <u>subsystem</u> shall be provided with an interface compatible with the methods of attachment to the structure or appendage agreed with the customer.

5.8.1.3 Modularity of the subsystem

- a. The explosive <u>subsystem</u> shall be assembled from modular components.
- b. The capability shall be provided to test the components separately.
- c. It shall be ensured that attachment, installation, repair and replacement can be done without affecting the surrounding equipment.

5.8.1.4 Avoidance of confusion <u>(only applicable for launch</u> <u>segment)</u>

- a. <u>For launch segment, it shall be ensured that components intended for different</u> applications cannot be confused.
- b. <u>For launch segment, inert components, dummies and test models used for test</u> purposes shall be visibly different from live items with the colour code in Table 5<u>-</u>1.

NOTE This is to prevent confusion and to ensure incorrect items are not used for flight or qualification.

Colours related to component behaviour	
Detonation	yellow orange
Deflagration	brown light
Inert	red orange bright
Colours related to the state or purpose of component	
Arm	red bright
Safe	green

Table 5-1 Explosive component colour code

5.8.1.5 Accessibility

- a. Access shall be provided throughout the space vehicle integration
 - 1. to the initiators, safe, test, and arm plugs for connection,
 - 2. for measurements of properties,
 - 3. to all elements for inspection.
- b. Access shall be safe and convenient as agreed with the customer.

5.8.1.6 Mechanical input to ICD

a. Complementary mechanical requirements before and after firing the explosive device or subsystem may be specified by the customer by tailoring ECSS-E-ST-10-24.

5.8.2 Electrical

5.8.2.1 General

- a. <u>All explosive devices firing lines shall be initiated via a dedicated module</u> which incorporate the safety inhibits and is mechanically segregated, <u>electrically independent and screened</u>
- b. The explosive <u>subsystem</u> shall provide power pulses to initiators at the times required by the application.
- c. The power pulse, shape, amplitude and duration shall be as specified in the initiator input requirements.
- d. It shall be demonstrated by test that 5.8.2.1c is met.
- e. If the firing source circuit takes power from the host vehicle either <u>the design</u> <u>shall comply with</u>:
 - 1. The return side <u>is</u> not be grounded on the payload side of the interface, and be isolated from payload structure by at least 10 k Ω measured at least 1,5 times the bus voltage, or
 - 2. Isolation converters <u>are</u> used to provide at least 10 k Ω isolation between payload return circuit and host vehicle return circuit when measured at least 1,5 times the bus voltage.

5.8.2.2 Circuit independence

- a. <u>Each electrical or optical initiator</u> shall be connected <u>to a dedicated electrical or</u> <u>optical firing line</u>.
- b. A separate command shall activate each component for launch vehicles.
- c. In case 5.8.2.2a is not met, the alternative circuit shall be justified and agreed with the customer and suppliers.
- d. The circuits shall be verified by test or analysis to meet the requirements on reliability and on the prevention of unintentional function.

NOTE See clauses 5.2.2 and 5.5.2.

5.8.2.3 Power <u>subsystem</u> overload

a. The power supply shall ensure that the power subsystem is not overloaded before, during or after the actuation of any explosive device even in case of a single-point failure together with a short circuit (both pin-to-pin and pin-to-ground).

5.8.2.4 Electromagnetic compatibility (EMC)

- a. The explosive <u>sub</u>system power, command, and control electrical circuitry shall limit the generation of electromagnetic fields or conducted noise to a level at least 20 dB below the no-fire power rating.
- b. The explosive <u>sub</u>system shall provide shielding to the same levels <u>specified in</u> 5.8.2.4a when exposed to <u>conducted and radiated susceptibility tests</u>.
- c. Control circuits shall limit the power level at any barrier to at least 20 dB below the minimum activation power.

5.8.2.5 Electrostatic discharge

- a. <u>The explosive sub</u>system's <u>power</u>, <u>command</u> and <u>control electrical circuitry</u> shall:
 - 1. survive,
 - 2. not be degraded by specified electrostatic discharges,
 - 3. be <u>testable</u> to verify survivability.
- b. Protective features shall be provided to
 - 1. prevent initiation,
 - 2. prevent change of state of <u>the safety</u> barriers,
 - 3. prevent parasitic paths,
 - 4. be tested to verify effectiveness.
- c. Electrostatic discharge to ground through the explosive elements shall be prevented.
- d. Build-up of electrostatic charges shall be prevented.
- e. Measures to satisfy requirement 5.8.2.5d shall not violate single-point grounding requirements.
- f. All ESD-sensitive components shall be identified and listed.
- g. Unplanned electrostatic discharges shall be avoided.

5.8.2.6 Voltage drop

a. The voltage drop in the electrical circuit shall be incorporated in the provision of the required firing pulse.

5.8.2.7 Electrical bonding

a. The resistance to electrical ground shall not exceed the specified value.

NOTE See requirements on "Electrical bonding" in ECSS-E-<u>ST-</u>20-07.

- b. The metallic parts of the explosive <u>devices</u> shall be bonded by direct contact.
- c. The shielding of the <u>electrical pigtailed explosive devices</u> shall be bonded at both ends<u>of connector and its explosive device</u>.

5.8.2.8 Isolation

- a. Every electrical firing circuit and monitoring circuit shall be electrically independent.
- b. The explosive <u>sub</u>system shall isolate the function to prevent power drain or parasitic paths before and after firing.
- c. Provision shall be made to isolate power lines and return lines of the explosive subsystem from electrical ground.
 - NOTE This is to prevent continued drain on the power <u>subsystem</u> after firing when e.g. short circuit to ground can occur.
- d. Provisions for redundancy shall not prevent fulfilment of the requirement 5.8.2.8a.
- e. Safe and arm device control and check-out circuits shall
 - 1. be independent of the firing circuits,
 - 2. use separate non-interchangeable connectors.

5.8.2.9 Insulation resistance

a. The explosive <u>sub</u>system shall neither function nor degrade as a result of the potential difference between the firing circuits and the shielding or the ground within specified limits.

5.8.2.10 Dielectric strength

a. The explosive <u>sub</u>system shall neither function nor degrade as a result of leakage current of electrical firing circuits to ground.

5.8.2.11 Sensitivity to RF energy

a. When exposed to RF conditions, the induced power shall not exceed a level <u>of</u> 20 dB below no-fire power and 20 dB below the RF sensibility threshold:

NOTE If no RF-limit is known, the DC-limit can be used.

b. When exposed to RF conditions, the explosive <u>sub</u>system shall not be degraded.

5.8.2.12 Magnetic cleanliness

a. The maximum level of residual magnetism shall be agreed with the end-user.

NOTE Reduced levels can be achieved by the choice of suitable materials.

- b. The supplier shall provide the customer with the magnetic properties of the <u>explosive devices</u>.
- c. The explosive <u>subsystem</u> shall not generate magnetic fields exceeding the "Electromagnetic interference safety margins" defined in <u>clause 6.3.1 of ECSS-E-ST-20</u>.

5.8.2.13 Lightning

- a. For launch segments, in accordance with the direct and indirect lightning environment provided by the customer, the explosive subsystems shall preclude <u>unwanted firing</u> due to electrical potential differences generated within the explosive <u>sub</u>system.
- b. Explosive <u>subsystems</u> should preclude degradation by exposure to lightning.

5.8.2.14 Electrical input to ICD

a. Complementary electrical requirements before and after firing the explosive device or subsystem may be specified by the customer by tailoring ECSS-E-ST-10-24.

5.8.3 Thermal

5.8.3.1 Sensitivity

- a. Explosive <u>sub</u>systems and components shall:
 - 1. survive to defined thermal loads in terms of intensity, duration and cycling,
 - 2. not be degraded by defined thermal loads in terms of intensity, duration and cycling,
 - 3. be tested to verify survivability.
- b. Protective features shall:
 - 1. be provided to prevent unintended initiation,
 - 2. be provided to prevent loss of performance,
 - 3. be tested to verify effectiveness.
- c. Build-up of heat shall be prevented.
- d. All thermally-sensitive <u>explosive devices</u> shall be shielded or otherwise protected from the environment.
- e. <u>Explosive devices shall not decompose when exposed to thermal environments</u> that are 30 °C above the maximum predicted temperature and 10 °C below the minimum predicted temperature during worst case service life.
 - NOTE This is to ensure no <u>self</u>-ignition <u>under</u> cook-off <u>test</u>.

5.8.3.2 Heat generation

a. The explosive <u>subsystem</u> shall not generate heat causing temperatures which exceed the specified limits.

5.8.3.3 Thermal input to ICD

a. Complementary thermal requirements before and after firing the explosive device or subsystem may be specified by the customer by tailoring ECSS-E-ST-10-24.

5.8.4 Status check

5.8.4.1 General

- a. The explosive <u>sub</u>system shall provide for
 - 1. measurements of electrical or optical properties during the integration of any circuit before and after firing, without inducing firing, unintentional status changes or degradation;
 - 2. the indication of at least the status of the <u>Safe</u> and <u>Arm Device</u> during the mission.
- b. The functionality shall be provided to verify the status of the barriers <u>of</u> the <u>Safe</u> <u>and Arm Device</u>.
- c. Check-out circuits shall not allow current flow or electrostatic discharge causing unintentional effects in the explosive <u>sub</u>system.

NOTE This applies also after any single failure.

- d. Any checking out of the status of electrical initiators shall limit the check-out current to $10^{-2} \times$ the "no-fire" \times current on the bridge wire.
- e. Any checking-out of the status of optical initiators shall limit check-out <u>power</u> to:_10⁴ (<u>TBPU</u>) × the "no-fire" power at the fire wavelength on the optical interface if the fire wavelength is used.
- f. The checking-out power or current or optical wavelength or frequency shall cause no unintentional effects or hazards, also after any single failure.
- g. Any checking-out of the insulation resistance of the explosive <u>subsystem</u> shall limit the voltage to 50 <u>V DC</u>.
- h. Provision shall be made for an immediate warning signal to be given for any unplanned change of status of any explosive <u>subsystem</u> control or check-out device.
 - NOTE E.g. thermal control requirements or material temperature limits.

5.8.4.2 Initiator status

- a. Provision shall be made for on-ground checking the status of initiators.
- b. Provision shall be made for access to the interface.
- c. Requirements for access shall be communicated to the end-user and facilities authorities.
 - NOTE Range safety sometimes prohibits use of these features.

5.9 Materials

- a. All materials, including explosive substances, shall be compatible with those materials with which they can come into contact.
 - NOTE 1 Outgassing can occur during e.g. polymerization, degradation of polymers.

- NOTE 2 Selection of materials and processes are done in conformance with ECSS-E-ST-32-08, ECSS-Q-ST-70, and ECSS-Q-ST-70-71.
- NOTE 3 Explosive <u>subsystems</u> use materials (e.g. explosives, propellants, powder, binders, cleaning agents, cements) that can be toxic, corrosive, highly reactive, flammable, and dangerous with direct contact.
- b. Continued exposure to the expected environmental conditions shall not cause degradation or increased sensitivity in excess of agreed limits.
- c. Any sealing system used to prevent degradation shall be demonstrated to be effective.
- d. No cracking shall be allowed due to <u>thermal mechanical</u> shock loads.

NOTE Materials can become brittle at low temperatures.

- e. Age-sensitive materials shall only be used where degradation causes no loss of explosive <u>subsystem</u> performance beyond limits agreed with the end-user.
- f. The nature and condition of age-sensitive materials shall be identified and documented in the DMPL.
- g. The nature and condition of explosive materials shall be identified and documented in the DMPL.
- h. Explosives that can react in response to normal environmental stimuli shall only be used in agreement with the end-user.
- i. The properties of the explosives shall be reported and shall be compared with the mission requirements.
- j. Degradation of the explosives shall not exceed agreed limits.
- k. Degradation of explosive characteristics shall be determined by test.

NOTE Test methods can be DTA, DSC, TGA, VTS.

5.10 Non-explosive components and equipment

5.10.1 Connectors

- a. There shall be only one connection per pin.
- b. The requirements of clause 5.7.2 shall apply to non-explosive components and equipment.
- c. Mis-mating of connectors shall be impossible.

NOTE E.g. by geometry, lay-out, dimensions, or harness length.

- d. The insert polarization and contact arrangement of the connectors used in the explosive <u>subsystem</u> shall not be used elsewhere on the space vehicle.
- e. <u>Initiator connector</u> shall be terminated by <u>male</u> contacts.
- f. Spare or un-terminated contacts shall not exist.

- g. Prime and redundant circuits for the same function shall not pass through the same connector.
- h. Electrical connectors shall provide continuous shielding in all directions.
- i. Electrical connectors shall provide continuous shielding during
 - 1. engagement before the pins connect,
 - 2. disengagement after the pins disconnect.
- j. Connector-savers <u>should</u> be used_.
 - NOTE This is to prevent the receptacle and contacts from wear and damage.

5.10.2 Wiring

- a. Electrical supply for each initiator, optical source and Safe and arm device shall be by a separate shielded, twisted-pair line or coaxial cable.
- b. All connections between conductors shall be made by soldering, crimping or connectors.

NOTE For soldering see ECSS-Q-ST-70-08. For crimping<u>, see</u> ECSS-Q-ST-70-26. For connectors_z see <u>Clause</u> 5.10.1.

5.10.3 Shielding

- a. The firing circuit including the initiator shall be shielded.
- b. Isolators shall provide 20 dB attenuation at the specified electromagnetic frequencies.
- c. Cable shielding shall provide \geq 90 % optical coverage.
- d. Double layer cable shielding should be used.
- e. For all other elements shielding, there should be shielding at 100 % optical coverage.

NOTE For example, no gaps or discontinuities, full shielding at the back faces of the connectors, no apertures in any container housing elements of the firing circuit.

- f. Shields shall not be used for current carrying.
 - NOTE Shields can be multiple-point grounded to the structure.

5.10.4 Faraday cap

- a. Faraday caps shall be used <u>at the input interface of the explosive devices</u>.
- b. The Faraday cap shall prevent EEDs to be initiated <u>or damaged</u> by electromagnetic <u>interferences</u>.

5.10.5 Safety cap

- a. Safety caps shall be used.
- b. The safety cap shall contain the products of initiation of an explosive device.
- c. It shall not be possible to install an explosive device with the safety cap mounted.

5.10.6 Power

- a. The explosive <u>subsystem</u> shall make use of the available voltage and current supplies from the power subsystem to produce power pulses of suitable size, duration and timing for each of the functions.
- b. The firing pulse requirements in Table 5<u>-</u>3 row 5 and Table 5<u>-</u>5 row 1 shall apply for EEDs and laser initiators respectively.
- c. The power provided at the power distribution points shall be such that the requirements of 5.8.2.6 allowing for losses are met.

5.10.7 Safe and arm connector

- a. A connector shall be provided on the exterior surface of the space vehicle for use with manually inserted plugs to enable:
 - 1. isolation,
 - 2. coupling of any explosive <u>subsystem</u>,
 - 3. testing of any explosive <u>subsystem</u>.
- b. Provision shall be made for access to the interface.
- c. Requirements for access shall be communicated to the customer and facilities authorities.
- d. The safe and arm connector shall be visibly identifiable.
- e. The safe and arm connector shall be qualified for the number of specified connection cycles.

NOTE E.g. to cover integration, test and use.

f. The receptacle shall meet the requirements of clause 5.10.1.

NOTE Sub-D connector, self-locking bayonet or triple start thread type can be used.

g. A connector-saver shall be used.

NOTE This is to prevent the receptacle and contacts from wear and damage.

5.10.8 Safe plug

- a. For electrical initiators, the safe plug shall
 - 1. short circuit each initiator,
 - 2. ground each shorted initiator circuit,

- 3. short-circuit each firing circuit,
- 4. ground each firing circuit.
- b. For optical initiators, the safe plug shall be capable of absorbing or redirecting n times the maximum power the laser can generate, with n defined by the end-user.
- c. The safe plug shall be
 - 1. compatible with the safe and arm connector receptacle,
 - 2. suitable for use with flight hardware,
 - 3. suitable for the number of connection cycles necessary to cover integration, test and use,
 - 4. scoop proof,
 - 5. lockable,
 - 6. visibly identified,
 - 7. carrying a "Remove before Flight" banner.

NOTEExamples of lockable safe plugs are sub-D connector,
bayonet or triple-start thread types.

5.10.9 Arming plug

- a. The arming plug shall:
 - 1. provide electrical continuity between the supply and firing circuits with electrical properties in any line agreed with the customer,
 - 2. be compatible with the safe and arm connector,
 - 3. be scoop-proof,
 - 4. be lockable,
 - 5. be visibly identified.

<u>NOTE 1 Electrical properties include resistance, isolation,</u> <u>bonding, and Faraday protection.</u>

<u>NOTE 2 Examples of lockable arming plugs are sub-D</u> <u>connector, bayonet or triple-start thread types.</u>

5.10.10 Test plug

- a. The test plug shall:
- 1. provide electrical access to the firing circuits with electrical properties in any line agreed with the end-user,
- 2. be compatible with the safe and arm connector,
- 3. not carry any potential or current at the time of insertion or removal,
- 4. be suitable for the number of connection cycles necessary to cover integration, test and use,
- 5. be suitable for use with flight hardware,

- 6. be scoop-proof,
- 7. be lockable.
 - NOTE 1 Electrical properties include resistance, isolation, bonding, and Faraday protection.
 - NOTE <u>2</u> Examples of lockable test plugs are sub-D connector, bayonet or triple-start thread type.

5.10.11 Safe and arm device

5.10.11.1 General

- a. Electrically actuated safe and arm devices should be used.
- b. A safe and arm device shall
 - 1. be used in applications where unplanned initiation of the explosive <u>subsystem</u> can cause injury, death, or severe damage to property,
 - 2. prevent the mounting of initiators in armed position,
 - 3. provide means of remote arming,
 - 4. provide means of remote safing,
 - 5. provide safing without passing through the armed position,
 - 6. prevent manual arming,
 - 7. provide manual safing and prevent unwanted return to arm,
 - 8. remain in the selected position under all conditions except when intentionally activated,
 - 9. prevent remaining in any state between 'safe' and 'arm',
 - 10. arm within a time interval agreed with the end-user,
 - 11. not require a force or torque to safe, exceeding a value agreed with the customer,
 - 12. if actuated remotely, safe within a time interval agreed with the end-user.
- c. It shall not be possible to arm the safe and arm device in case an initiator has been activated with the safe and arm device in safe position.
- d. The safe and arm device shall be capable of being manually positioned to "safe" during any phase of this cyclic life.
- e. The barrier shall be removable, or a reconnection shall allow propagation ("Armed" condition) when commanded.
- f. Remote operation and status indication shall be provided.
- g. Local visible unambiguous status indication shall be provided.
- h. All additional blocks shall be flagged "Remove before flight".
 - NOTE Safe and arm devices can use initiator-simulator resistors.

5.10.11.2 Electrically actuated

- a. The electrically actuated safe and arm <u>devices shall be designed to withstand</u> repeated cycling from Arm to Safe for at least five times the expected number of cycles, without any malfunction, failure, or deterioration in performance;
- b. The electrically actuated safe and arm device shall have a demonstrated cyclic life of 1000 safe-to-arm-to-safe transitions, or five times the number of transitions predicted during its lifetime, whichever is greater, without failure or degraded performance.

5.10.11.3 Mechanically actuated

a. The mechanically actuated safe and arm <u>devices</u> shall <u>be designed to withstand</u> repeated cycling from Arm to Safe for at least five times the expected number of cycles, without <u>any malfunction</u>, failure, or <u>deterioration in</u> performance.

5.10.11.4 Safing

- a. Safing shall prevent detonation or initiation transfer by
 - 1. the placement of a barrier between the initiator and next explosive element, or
 - 2. misalignment of the initiator and the next explosive element.
- b. Safing shall disconnect power and return firing lines.
- c. Safing shall short the EEDs.
- d. Safing should ground the shorted EEDs through a resistance agreed with the end-user.
- e. Safing shall have resistor(s) with a resistance exceeding 10 k Ω if these resistor(s) remain connected to the firing circuit in the arm position.

NOTE Clause 5.1.2a applies.

5.10.11.5 Arming

- a. Arming shall enable detonation or initiation transfer by
 - 1. the removal of a barrier between the initiator and next explosive element, or
 - 2. alignment of the initiator and the next explosive element.
- b. Arming shall:
 - 1. connect firing power lines and return lines to EEDs,
 - 2. remove the short from the EEDs,
 - 3. disconnect the EEDs from the ground.
- c. During transition from "safe" to "arm" each electrical switch shall disconnect before connecting to the next circuit.

NOTE Clause 5.1.2. applies.

5.10.11.6 Status indicators

a. The device shall:

- 1. provide remote status indications,
- 2. provide local status indications,
- 3. indicate "Arm" status with a black "A" on a red background or a red "A",
- 4. indicate a "Safe" status with a white "S" on a green background or a green "S".
- b. The status indications shall be unambiguous.
- c. Visibility of the status indicators when installed on the spacecraft or launcher shall be ensured.

5.10.11.7 Initiator-Simulator resistors

a. Application of operational voltages for at least 20 seconds shall not degrade the Safe and Arm performance or cause initiation of explosives.

5.10.12 Initiator harness connector

- a. The initiator harness connector shall conform to the interface requirements of the integral connector of the initiator.
- b. The initiator harness connector shall not be used for other purposes on the space vehicle.

5.10.13 Initiator test substitute

a. Any initiator test substitute shall be representative with respect to properties which affect the results of the test.

5.11 Explosive components

5.11.1 General

5.11.1.1 Applicability

- a. Clauses from 5.11.1.2 until 5.11.6 shall apply to explosive components, which cannot be fully tested before flight.
- b. For other elements of the <u>subsystem</u>, which can be fully tested before flight, the equipment environmental test conditions of the end-user shall apply.
 - NOTE The requirements for explosive components are given below as measurements to be made after specific preconditioning and under survival and operational conditions identified in 5.6.

5.11.1.2 Identification

a. Identification marking shall be in conformance with ECSS-M-ST-40<u>, clause</u> <u>5.3.1.5</u>.

- b. For launchers colour coding shall be used on components to indicate behaviour.
- c. Each component containing explosives shall be visibly and permanently marked with:
 - 1. a unique identification,
 - 2. coding to indicate behaviour.
- d. Identification should include Manufacturer, Part number, Lot number, Serial number, Manufacturing date<u>stating month and year</u>.
- e. Colour coding should be in conformance with Table 5<u>-</u>1.

5.11.1.3 Contamination

- a. The following types of contamination shall be prevented.
 - 1. from environment to the components;
 - 2. from components to the environment;
 - 3. related to the innocuousness of component during and after functioning.
 - NOTE Contamination can be prevented e.g. by the use of approved materials in conformance with ECSS-Q-ST-70-71 and by design to contain products of the operation of explosive components.
- b. In case clause 5.11.1.3a cannot be met, a component shall not be accepted unless the limits of the amount and type of contamination are identified by the manufacturer and agreed with the end-user.

5.11.1.4 After functioning

- a. After functioning, no explosive component shall cause
 - 1. any disturbance beyond limits agreed with the end-user,
 - 2. contamination beyond limits agreed with the end-user.

5.11.2 Initiators, cartridges, detonators, and packaged charges

5.11.2.1 General

- a. The properties of initiators given in Table 5<u>-</u>2 shall be quantified and conform to the figures where shown.
- b. Under the conditions in column E of Table 5-2, the properties in column A, expressed in the units specified in column B, shall be between the values in column C (maximum) and column D (minimum).

Table 5<u>-</u>2 Common requirements for initiator, cartridge, detonator, and packaged charge properties

		Α	B	C	D	Е	F

1	.0	Lifetime	Year	TBPM	N/A	For transport, storage and operation	

5.11.2.2 1W / 1A No-Fire initiators

- a. The minimum no-fire rating shall be 1A (current) or 1W (power) for five minutes.
- b. The firing probability when subjected to the no-fire current or no-fire power for five minutes shall be less than 0,001 at 95 % confidence level.
- c. After exposure to the no-fire current or no-fire power, the EED shall be capable to function in conformance with its requirements.
- d. The properties of the 1W / 1A No-Fire initiator given in Table 5<u>-</u>3 shall be quantified and conform to the figures where shown.
- e. Under the conditions in column E of Table 5₋3, the properties in column A, expressed in the units specified in column B, shall be between the values in column C (maximum) and column D (minimum).

	A	B	C C	D	E	F
#						
π	Property	Unit	Maximum value	Minimum value	Condition	Notes

5.11.3 Integral initiator connectors

5.11.3.1 General

a. The configuration of the connector shall be used only for initiators.

NOTE This is the integral (upper) part of the initiator.

b. The interface shall allow for sealing.

5.11.3.2 Electrical initiator connector

- a. The connector thread or closing mechanism shall be self locking.
- b. The connection shall have electrical continuity with a resistance < $10 \text{ m}\Omega$.
- c. The connector shall be able to undergo 50 mating-demating cycles without degradation.
- d. The connection shall be able to undergo specified <u>thermal and mechanical</u> <u>environments</u> without degradation.

5.11.3.3 Laser initiator connector

- a. The initiator shall incorporate an interface to match the interfaces on the fibre optic connector and the adapter which is used to join the two items.
- b. The connector interface shall not be used for any purpose other than explosive devices.
- c. The connector thread or closing mechanism shall be self locking.
- d. The connection shall have electrical continuity with a resistance < $10 \text{ m}\Omega$.
- e. The connector shall be able to undergo 50 mating / de-mating cycles while meeting its requirements.

5.11.4 Transfer devices

5.11.4.1 General

- a. The properties of transfer devices shall conform to the general requirements of Table 5<u>-</u>9 and be quantified.
- b. Under the conditions in column E of Table 5<u>-</u>9, the properties in column A, expressed in the units specified in column B, shall be between the values in column C (maximum) and column D (minimum).

<u>6</u>	<u>Lifetime</u>	<u>Year</u>	<u>TBPM</u>	<u>N/A</u>	During transport, storage and mission	

5.11.10 Explosive delays

- a. The properties of explosive delays given in Table 5-15 shall be quantified and conform to the figures where shown.
- b. Under the conditions in column E of Table 5-15, the properties in column A, expressed in the units specified in column B, shall be between the values in column C (maximum) and column D (minimum).

I		<u>A</u>	<u>B</u>	<u>C</u>	<u>D</u>	<u> </u>	<u>F</u>

5.12 Explosively actuated devices

5.12.1 General

- a. For any explosively actuated device which incorporates initiation and explosive charges the requirements of Clause 5.11 shall apply.
- b. No released part shall cause damage.
- c. The requirements of Table 5<u>-</u>16 shall apply.
- d. Under the conditions in column E of Table 5<u>-</u>16, the properties in column A, expressed in the units specified in column B, shall be between the values in column C (maximum) and column D (minimum).

	Table 5-16 General requirements for explosively actuated device properties

5.12.2 Separation nuts and separation bolts

- a. The properties of the separation nut and bolt given in Table 5<u>-</u>17 shall be quantified and conform to the figures where shown.
- b. Re-settable separation nuts shall include a means of verifying that the nut is properly reset before and after its mating bolt or stud installation and torquing.
- c. The pre-load shall be specified.
- d. The pre-load shall exceed the maximum expected amplitude of the dynamic tension in the bolt and effects of thermal variations.

<u>NOTE</u> The safety margin on the pre-load is positive under mechanical and thermal environment.

e. Under the conditions in column E of Table 5-17, the properties in column A, expressed in the units specified in column B, shall be between the values in column C (maximum) and column D (minimum).

5.12.3 Pullers

- a. The properties of the puller given in Table 5<u>-</u>18 shall be quantified and conform to the figures where shown.
- b. The puller shall be capable to withdraw the pin under maximum shear and bending loads.
- c. The retractable pin shall not rebound.
- d. Under the conditions in column E of Table 5-18, the properties in column A, expressed in the units specified in column B, shall be between the values in column C (maximum) and column D (minimum).

-	Table <u>3-</u> 18 Kequirements for puner properties

3	Pulling stroke	mm	TBPM	TBPM					

Table 5<u>-</u>18 Requirements for puller properties

5.12.4 Pusher

a. The properties of the pusher given in Table 5-19 shall be quantified and conform to the figures where shown.

- b. Pushers shall be able to withstand the expected loads during operation.
 - NOTE These loads comprise e.g. compression and shear and bending moment.
- c. Under the conditions in column E of Table 5<u>-</u>19, the properties in column A, expressed in the units specified in column B, shall be between the values in column C (maximum) and column D (minimum).

Table 5-19 Requirements for pusher properties

3	Dimensions of generated particles	mm	TBPM	TBPM		Range of size associated with load and load carrier properties					

Table 5-20 Requirements for cutter properties

5.12.6 Valves

a. The properties of the valve given in Table 5<u>-</u>21 shall be quantified and conform to the figures where shown.

- b. After firing the valve piston shall remain in its actuated position.
- c. The type of valve NO or NC shall be marked on the device.
- d. The flow direction shall be marked on the device.
- e. Under the conditions in column E of Table 5-21, the properties in column A, expressed in the units specified in column B, shall be between the values in column C (maximum) and column D (minimum).

	Α	В	C	D	E	F
#	Property	Unit	Maximum value	Minimum value	Condition	Notes
1	Valve capabilities				Associated with fluid properties

2	Mass of generated particles	mg	TBPM	N/A	in fluid circuit	
3	Dimensions of generated particles	mm	TBPM	TBPM	in fluid circuit	

Table 5-21 Requirements for valve properties

5.13 Items external to the flight equipment

5.13.1 GSE

- a. Verification of GSE shall be performed in conformance with ECSS-E-ST-10-02.
- b. Ground support equipment shall provide support and protection within specified limits including ESD and EMI.
- c. Test equipment shall be energy limited in conformance with 5.8.4.

NOTE E.g. electrical, optical.

- d. <u>Prior any test and verification, the status indication of the explosive sub</u>system shall be provided to the AIT team.
- e. Changes in the status indications shall be provided.
- f. Status and status changes shall be recorded.

5.13.2 Test equipment

- a. Integration and test facilities and equipment shall be in accordance with ECSS-E-ST-10-02.
- b. Uncontrolled modifications to equipment or procedures shall be prohibited.

5.13.3 Launch site

- a. The launch site shall provide specified transport, handling and storage facilities for explosive components and <u>subsystem</u>s.
- b. The status of explosive safety barriers shall be monitored when the space vehicle induces a catastrophic risk.

NOTE The space vehicle comprises e.g. the launcher, satellite, spacecraft.

- c. Provisions shall be made to make visible the status of explosive safety barriers.
- d. Any indicators used to show the status of the explosive devices and the barriers shall be clear and unambiguous.
- e. Periods of sensitivity to external environment shall be notified to the authorities.

NOTE Example of external environment is EMI.

f. Provisions shall be made for access to safe and arm devices for manual disarming.

5.14 Verification

5.14.1 General

a. Following exposure to the conditions specified in Clause 5.14.3, explosive devices and <u>subsystems</u> shall meet the performance requirements specified in the appropriate Clauses 5.10, 5.11 and 5.12 when measured in conformance with the requirements of Clause 5.14.3.

5.14.2 Inspection

- a. Inspection shall be performed in conformance with ECSS-Q-ST-20.
- b. Non-destructive inspection shall be used to demonstrate specified assembly and condition of every explosive component.

NOTE E.g. X-Ray or N-Ray.

c. Resolution shall be better than the dimension of the smallest feature to be checked.

NOTE To be able to detect e.g. micro-cracks.

d. It shall be demonstrated by inspection of all fired components that the internal dimensions, surfaces and material properties have not been degraded beyond specified limits.

NOTE Erosion, corrosion and burning due to the functioning can cause failure or leakage.

5.14.3 Tests

5.14.3.1 Test specification

- a. Test specification (TSPE) shall be in conformance with the DRD in Annex B of ECSS-E-ST-10-03.
- b. The test conditions for explosive components and <u>subsystem</u>s shall be derived from the operational conditions and constraints.

NOTE E.g. ground, flight, in orbit.

- c. Qualification and lot acceptance tests shall be in conformance with clause 5.14.4.
- d. Acceptance tests shall be done at identical limit conditions and levels, whatever the application, to ensure valid reference to previous results and to reduce the numbers of tested items.

5.14.3.2 Test procedure

a. Test <u>procedure (TPRO)</u> shall be in conformance with <u>the DRD in Annex C of</u> ECSS-E-ST-10-03.

5.14.3.3 Test reports

a. Test <u>report (TRPO)</u> shall be <u>in conformance with the DRD in Annex C of ECSS-E-ST-10-02</u>.

5.14.3.4 Essential confirmation

a. For every test, connection to the correct initiator shall be checked and recorded.

5.14.3.5 Routing tests

- a. It shall be <u>verified by test</u> that the correct stimulus arrives at the correct initiator and no other.
- b. Records shall be kept of the routing test.

5.14.3.6 End-to-end tests

- a. Functional tests shall be performed in conformance with ECSS-E-ST-10-03.
- b. Only planned and approved activities shall be performed, in conformance with approved procedures.
- c. Firing tests shall not be performed until a successful rehearsal has been completed.

5.14.3.7 Safety tests

a. Safety tests shall be performed on unpacked articles in conformance with Table 5-22.

Table 5<u>-</u>22 Safety tests

Reference tests	TEST Method	Recommended sequence		
		Launcher	Spacecraft	
Slow cook-off	UNO "Manual of tests and criteria" test 7 (h)	R	N/A	
External Fire	UNO "Manual of tests and criteria" test 7 (g)	R	N/A	
Handling Drop test (e.g. 2 m height)	ТВРС	R	0	
12 m Drop test	UNO "Manual of tests and criteria" test 4(b)	R	N/A	
Mechanical Shock	ТВРС	0	N/A	
Lightning	ECSS <u>-</u> E-ST-20-07, clause "Lightning environment – Requirements for the space system"	0	N/A	
R : Required	O: Optional N/A: No	ot Applicable		

5.14.3.8 Lifetime demonstration

- a. Lifetime tests or analysis shall be done to establish changes over time in performance and susceptibility.
- b. If accelerated ageing is used, it shall be justified.

5.14.3.9 Reliability tests

- a. For any component performances shall be declared in terms of reliability, confidence level, test, and analysis methods.
- b. <u>The supplier shall justify the selected method</u> used for the <u>reliability</u> <u>demonstration.</u>

<u>NOTE</u> The methods in Table 5-23 are given for information. (refer to www.gtps.fr website).

Component	Method
Initiator	<u>GTPS 11C-</u> Bruceton or <u>GTPS11B - One</u> <u>Shot or Neyer or <mark>CABOUM</mark> method</u>
Cutter / Release nut /Valve/Pusher/Puller	<u>GTPS11F :</u> Severe method
TBI	<u>GTPS11F</u> Severe method
Shaped charge	<u>GTPS11A</u> Probit or <u>GTPS11F</u> severe method
Expanding tube	<u>GTPS11A</u> Probit or <u>GTPS11F</u> severe method
Transmission lines	<u>GTPS11C</u> Bruceton or <u>GTPS11B - One</u> <u>Shot</u> Neyer or <u>GTPS11F</u> Severe method or <u>CABOUM</u> method

Table 5<u>-</u>23 Reliability methods

5.14.4 Qualification and lot acceptance

5.14.4.1 General

- a. Qualification and acceptance of explosive components and <u>subsystems</u> shall be in conformance with ECSS-Q-ST-20.
- b. For qualification, each device shall meet the requirements specified in the appropriate table of clauses 5.11 and 5.12 after exposure to the complete sequence of conditions specified in Table 5<u>-</u>24.
- c. For lot acceptance, each device shall meet the requirements specified in the appropriate table of clauses 5.11 and 5.12 after exposure to the selected conditions specified in Table 5_{-2}^{-25} .
- d. For lifetime, each device shall meet the requirements specified in the appropriate table of clauses 5.11 and 5.12 after exposure to the complete sequence of conditions specified in Table 5_224 .
- e. Dynamic leak measurement shall be made under vacuum.

5.14.4.2 Qualification tests

a. Qualification tests shall be performed in conformance with Table 5<u>-</u>24.

NOTE Typical values are given in Annex A.

Qualification test	ECSS-E-ST-10-03	ECSS-E-ST-10-03	Spacecraft	Launcher
(see Note 3)	reference	sequence	component	component
no-fire stimulus	NO	additional	R	R
physical properties (measurement)	YES	1	R	R

Note 3: See Table for 'Accepta	nce test' in ECSS-E-S	5T-10-03.						

5.15 Transport, facilities, handling and storage

5.15.1 General

a. Specified transport, handling, and facilities for explosive subsystems and devices shall be provided.

5.15.2 Transport

- a. <u>Explosives devices</u> shall be transported in conformance with <u>the latest version</u> <u>of</u> ST/SG/AC.10/1.
- b. If it is not possible to exclude explosive devices of class 1, according to ST/SG/AC.10/1, Chapter 2.1 par. 2.1.3.6 of UNECE, the explosive devices are assigned to Class 1 and the required transport classification should be 1.4 S.
- c. The containers shall protect the component from the <u>transport and storage</u> mission<u>profile</u>.
- d. Definition of containers shall be in conformance with <u>UNECE</u> regulations (ST/SG/AC.10/1 <u>latest version</u> Manual of Tests and criteria).
 - NOTE It is good practice to pack explosive components individually to prevent changes in humidity and electrostatic charge.
- e. Containers shall not be exposed to environments exceeding those specified.

NOTE It is good practice to use thermal and shock sensors.

- f. Identification label shall be marked before delivery in a permanent way on each deliverable.
- g. Containers shall be marked with the following information:
 - 1. Equipment name and part number
 - 2. Contents and quantity

- 3. Mass (gross and net) in kilograms
- 4. Contract number
- 5. Supplier name and address
- 6. EXPLOSIVE label with Hazard and compatibility classifications
- 7. Following label : "Open only in clean-room area by qualified operators" if necessary
- h. Container shall indicate the orientation to be kept maintained.
- i. Application of the directives CE93/15/EEC ; 2008/43/EG and 2012/4/EU shall be analysed by the manufacturer and applied if relevant.
- . A Safety Data Sheet (SDS) of the explosive device shall be provided in English and French languages.

NOTE A template of SDS is provided in informative Annex C.

5.15.3 Facilities

- a. <u>Explosive devices</u> shall be stored <u>in dedicated storages according to the national</u> regulations applicable for safety and security.
- b. The nature of and precautions required for all explosive <u>devices</u> and <u>sub</u>systems shall be communicated to <u>the</u> facility <u>designer</u>.
- c. Storage of explosive devices shall be performed in conformance with ECSS-Q-ST-20.
- d. All explosive devices shall be stored in temperature and humidity controlled secure storage areas except when required for controlled spacecraft activities.
- e. Records of all environmental conditions in locations where explosive components or <u>subsystem</u>s are stored or handled shall be maintained and be available for review.
 - NOTE E.g. environmental conditions such as thermal, humidity.
- f. The location of every live or fired explosive component or subsystem shall be known and identifiable at any time.

5.15.4 Handling

a. All handling shall be done by certified personnel <u>according to the national</u> <u>regulations and</u> in conformance with ECSS-Q-ST-20.

NOTE Handling includes testing, measuring, installing.

- b. All handling shall be done in conformance with specified procedures <u>and the</u> <u>specified Personal Protective Equipment</u>.
- c. Personnel and equipment shall be grounded to a common ground.
- d. Only approved tools, aids and test equipment shall be used for explosive devices.

- e. Consistent, coherent and complete records shall be maintained of components or <u>subsystem</u>s which have a direct effect upon the <u>subsystem</u>, including test activities and measurements during any upon the break-in activities.
- f. Restoration of the original accepted condition shall be required.
- g. The correctness of all connections shall be confirmed and a record of all connections shall be maintained.
- h. Site safety regulations, provisions and procedures shall be checked for adequacy for explosive activities.

5.16 In-service

5.16.1 Information feedback

- a. Checks shall be made to assure the consistency of information between different equipment at different stages in the launch preparation.
- b. Results of the checks specified in 5.16.2a shall be recorded.
- c. Information shall be provided of hardware and software provisions for the monitoring and command of explosive functions, and show changes from one stage to the next.
- d. RF links, wiring, connectors and pin functions shall be specified to check the source and destination.
- e. Diagrams or photographs of consoles and installations shall be provided.
- f. Confirmation shall be provided that no unwanted responses or drifts have occurred.

5.16.2 Launch site procedures

- a. Only planned and approved activities which follow approved procedures shall be undertaken.
- b. The activities specified in 5.16.2a shall include contingency actions.
- c. Rehearsals shall be performed.

5.16.3 Monitoring

a. Confirmation of operation shall be made available immediately.

5.17 Product assurance

5.17.1 General

- a. <u><<deleted>></u>
- b. <u>ECSS-Q-ST-10-04 shall be applied for all</u> explosive devices <u>identified</u> as critical items.

5.17.2 Dependability

- a. The explosive <u>sub</u>system shall be in conformance with all dependability requirements ECSS-Q-ST-30 Clauses 6, 7, 8 and 9.
- b. Age-sensitive parts and materials shall be identified.

5.17.3 Assembly, integration and test

- a. The properties of the subsystem and all activities shall meet the safety requirements defined in ECSS-Q-ST-40.
- b. Immediately before every electrical or optical connection and disconnection, it shall be confirmed that no conductor is live and that no power can flow or be interrupted across the interfaces.
- c. Immediately before every connection and disconnection it shall be confirmed that operator and parts are grounded to a common ground.

Annex A (informative) Component qualification test levels

Table A-1 provides test levels that can be used for the qualification of components. Table A-2 provides the pyroshock that can be used for launchers and satellites.

Environment		ne 5 ESC	Satellite			
	(see A5-SG-1-X-4	40 (Section Number))				
Cold	-80°C / 10 hours (5	5.2)*	-120°C / 48 hours

5 - FIRE-FIGHTING MEASURES	<u>s</u>		· ·				
Feared effects in case of fire:							
General measures:		Establish a safety perimeter. There must be no human intervention to fight fire from pyrotechnic objects. When possible, measures to stop the spread of the fire must be taken. Once the fire is extinguished, access to the site is possible only after making sure the whole area has cooled down.					
Suitable extinguishing media: Forbidden extinguishing media		Do not try to extinguish a pyrote	echnic fire				
Special protection equipment:		Fire fighting equipment – Self co	ntained respiratory pr	otective device			
Other provisions :							
6 - ACCIDENTAL DISPERSION	MEASU	JRES
